>Perhaps we need a totally new draw for the users to move to higher
>speeds. Any ideas?

Sure, you bet. I've talked about this in other threads. We must move away from the idea of logging into a central PC and sharing its resources with all other users. We need to start thinking in terms of applications which actively cooperate over the network to give us capabilities we can't easily provide on our own isolated machines.

There is currently research going on to make the *network* our computer, IE each computer on the network is only a component of the total computer resource available to us. This effectively gives us access to supercomputer power at low cost. We can't easily do this in conventional ways. We have to think in terms of agents, crawlers, applets, loosely coupled multiprocessing, etc.

As a trivial example, if I want to design an interdigital filter, I can purchase or download a filter design program to run locally on my machine, or I can use the one on WA4DSY's machine via the network. I do the latter because it avoids consuming disk resources on my machine with yet another program. Now this isn't yet transparent. I have to know that the program is on his machine, and I have to take an action to access and start it based on that knowledge. With a truly network aware OS, this becomes transparent, IE I just tell my machine I want to design a filter and it goes out and finds the resource needed to do it on the net, cranks up that resource and prompts me for parameter input. I don't even have to be aware that the program isn't running on my own local machine. New network aware OSs like Inferno can offer us this sort of network aware action.

Or I can dispatch an agent out into the network to search out some information I desire. It moves from site to site looking for what I want, collates the information for me, and notifies my machine how to access it. This is much more efficient than maintaining large search databases on every user's computer, and is less consumptive of network resources than direct queries from my machine to every other machine on the network.

Of course we have a chicken and egg situation here. We won't see many advanced applications until we have the network bandwidth to support them. And people are reluctant to field systems with the required bandwidth until they see applications which require it. In this situation, the internet can serve us by showing that such applications are possible, and prompt us to do likewise in the amateur world.

Kevin,
Timewave Technology Inc. acquired the AEA data products line (including the DSP-232) in April, 1997. The DSP-232 is currently undergoing a firmware revision to correct some bugs in the unit. When we are satisfied the firmware is bug-free, the DSP-232 will be re-introduced by Timewave. The new firmware will be available for all existing DSP-23s so they will be equivalent to newly manufactured DSP-232s. Timewave will not announce a specific schedule for the new firmware release - we are not interested in repeating previous problems by rushing out the new firmware release. Rest assured, this is a high priority project at Timewave and we will publicize it widely when it is released! Please send us an e-mail with your DSP-232 serial number, mailing/shipping address, phone number, and a description of any problems you may have with the unit. Some modes do not have any problems, so don't assume you will have problems. We will notify you when the new firmware is released.

Check out Timewave's website (http://www.timewave.com) for further information about the Timewave/AEA data hardware and software products, upgrades, accessories, and service. Many products are already in production and now we are accepting all PK-series products for repair.

73,
Randy Gawtry, K0CBH
Timewave Technology Inc.

> CHECKING that Packet has. PacTOR was designed specifically for HF

Both have error correction, however, packet was designed for multiple
stations to share the frequency, so it is "polite" and allows other
stations a chance to get in. Pactor, OTOH, is designed for only two
stations (in ARQ mode) and immediately acknowledges a received packet.
Pactor also has the capability to recover from certain errors by combining
two or more incomplete transmissions of the same packet. Packet merely
re-transmits a packet until it has been received perfectly. There are
other minor differences (such as a smaller packet size and overhead) that
gives Pactor its performance advantage.

I prefer Clover over Pactor because it allows a near full-duplex dialog and
it has somewhat better performance than Pactor-1. Pactor-2 is supposed to
be even better, but the cost of the modem is a little steep for my taste.

http://www.tapr.org/dcc
March 15th, 1997

1997 ARRL and TAPR Digital Communications Conference
October 10-12, 1997
Baltimore, Maryland (minutes from BWI airport)

Web: http://www.tapr.org/dcc

It's that time again! Time to mark your calendar and think about what to publish for the upcoming 16th Annual ARRL and TAPR Digital Communications Conference. 1997 marks the second year in which the ARRL Digital Communications Conference and TAPR Annual General Meeting have joined into one conference!

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related
technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but for digitally-orientated amateurs of all levels of experience.

The 1997 ARRL and TAPR Digital Communications Conference will be held October 10-12, 1997 in Baltimore, Maryland. This year's conference location
is just minutes away from the BWI (Baltimore/Washington International) Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes APRS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the frequency allocations we now have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one

of
the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner as well

The conference is not just for the digital expert. This year's conference will again provide an entire session strand with beginning, intermediate, and advanced presentations on selected topics in digital communications. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts! Don't miss this
opportunity to listen and talk to others in this area.

Symposiums and Seminars

In addition to the presentation of papers on Saturday, three symposiums/seminars will be held before and after the conference. These sessions are provided to allow those with additional time and interest to make the most of the Digital Communications Conference. For those that might have interest in just a symposium or seminar, registration for the conference is not necessary to register and attend one or more of the symposiums and seminars. This allows maximum flexibility for those that might want to participate during the Digital Communications Conference, but
do not have an entire weekend to devote to the event.

A full day symposium on Friday covering APRS will be conducted by Bob Bruninga, WB4APR (father of APRS) , Keith Sproul, WU2Z, Mark Sproul, KB2ICI
(developers of Mac and Windows APRS), Steve Dimse, K4HG (developer of javAPRS), and other nationally known APRS leaders. Join this group for the
afternoon and evening for in depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon a half-day seminar entitled "RF Basics for Computer Weenies: Helping the RF-challenged get the most out of the new high-speed wireless toys". The seminar will focus on such topic as basic antenna types and their characteristics, comparison of feedlines and connector types, propagation basics (calculation of path loss, multipath effects, fresnel zones, etc), weatherproofing, lightning protection, filters, basic RF measurements, and other issues related to maintaining radio equipment on the UHF/SHF bands. This seminar will be starting late enough in the afternoon on Friday to allow those flying on that day to attend the seminar.

On Sunday morning, Dewayne Hendricks, WA8DZP, Phil Karn, KA9Q, and Tom McDermott, N5EG, will conduct a seminar focusing on "Spread Spectrum system
design and theory." All three presenters are well known for their work in various areas of amateur digital communications and this 5 hour seminar should be an excellent opportunity to learn about the design and theory of spread spectrum systems. This seminar is a follow up to the past two seminars of PCS technology by Dewayne with a new focus on system design.

2nd Annual ARRL and TAPR DCC Student Papers Award

ARRL and TAPR especially welcome papers from full time students to compete for the second annual student papers award. Two $500 travel awards may be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate
directly to a wireless digital communication topic (see guidelines for more
information). Papers coauthored by educators or telecommunications professionals are also eligible for this award, as long as a student is the
first author. Deadline for receipt of finished student paper manuscript: June 20th, 1997. Please note that this deadline is different than the general conference submission date. For full details and paper guidelines contact TAPR or check http://www.tapr.org/dcc.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by August 20th, 1997, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to lweinberg@arrl.org. Information on paper submission guidelines are available on-line (http://www.tapr.org/dcc).

Local Co-Host

The 1997 ARRL and TAPR Digital Communications Conference will be co-hosted by AMRAD (Amateur Radio Research and Development Corporation).

The Amateur Radio Research and Development Corporation (AMRAD) is a worldwide club of amateur radio and computer experimenters whose purpose is
to develop skills and knowledge in radio and electronic technology, advocate design of experimental equipment and techniques, promote basic

and
applied research, organize technical forums and symposiums, collect and
disseminate technical information, and provide experimental repeaters.
http://www.amrad.org

What can you expect during the 1997 ARRL and TAPR Digital Communications
Conference ?

* A full day of papers, breakout sessions, and selected topics on Saturday
for the beginner to the advanced amateur digital enthusiast.

* Three seminars/symposiums
Friday (1pm) - APRS, Conducted by:
Bob Bruninga, WB4APR
Keith Sproul, WU2Z
Mark Sproul, KB2ICI
Steve Dimse, K4HG (coordinator)

Friday 3pm - RF Basics for Computer Weenies

Sunday (8:30am) - Spread Spectrum System Design and Theory,
Conducted by:
Dewayne Hendricks, WA8DZP
Phil Karn, KA9Q
Tom McDermott, N5EG

* The second annual Student paper awards.

* TAPR Membership Meeting

* A banquet with Special Guest Speaker (TBA)

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

* A meeting facility that is perfect for this type of meeting.

* Informal engineering discussions/demonstration areas.

* An event at which the most important new developments in amateur digital
communications are announced.

* Digital 'movers and shakers' from all over the world in attendance.

Conclusion

If you have attended a Digital Communications Conference in the past, just
remember back to how much fun it was discussing the latest developments
into the wee hours! If you have never been, then make your plans now to
attend and find out how much fun the Digital Communications Conference can
be.

There are few activities where your participation can be so much fun, and so important! Getting together with colleagues from all over the world and
bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make
your travel and lodging arrangements now. We hope to see you at the ARRL and TAPR Digital Communications Conference October 10-12!

Full information on the conference and hotel information can be obtained by
contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337,
Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544.
Internet: tapr@tapr.org Web: www.tapr.org/dcc

Sincerely,
Steve Ford, WB8IMY, ARRL Conference Co-Chair
Greg Jones, WD5IVD, TAPR Conference Co-Chair
Paul Rinaldo, W4RI, Local Host Liaison
Steve Stroh, N8GNJ, Asst Conference Manager

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings, and seminars will be held at the Holiday Inn BWI Airport. DCC special rooms rate is $89 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC to get the discount. It is highly recommended that you book your room prior to arriving - a block of 75 rooms is reserved until September 9th, 1997. After the 75 rooms are booked, rooms will only be available in nearby hotels. Be sure to book your rooms early! The hotel provides transportation to and from BWI Airport, nearby Amtrak/MARC rail station, and the local Baltimore Light Rail. Please contact the hotel
to arrange specific transportation needs.

Holiday Inn BWI Airport (conference hotel)
890 Elkridge Landing Rd, Linthicum, MD, 21090
(410) 859-8400, Fax (410) 684-6778

Registration

Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to preregister or for additional meeting information. MasterCard and VISA accepted.

- Preregistration (before Sept 10th) $42.00 *

- Late Registration or at door $47.00 *

* - Conference Registration includes:
Conference Proceedings, Saturday Sessions/Meetings, and
Lunch.

- Saturday Evening Dinner (Limited Space) $20.00 **

** - Dinner, Speaker: TBA, Prize Drawing

Seminar/Symposiums

Note: You do not have to be registered for the conference to attend one or
more of the seminars/symposiums.

Friday, 1pm - 8pm.
APRS Symposium (full day)
Conducted by:
Bob Bruninga, WB4APR
Keith Sproul, WU2Z
Mark Sproul, KB2ICI
Steve Dimse, K4HG - Symposium Coordinator

- Registration $25.00 ***

Friday 3pm - 7pm.
RF Basics for Computer Weenies (half-day seminar)
Conducted by (TBA)

- Registration $20.00 ***

Sunday 8:30am - 1:30pm
Spread Spectrum System Design and Theory
Conducted by:
Dewayne Hendricks, WA8DZP
Phil Karn, KA9Q
Tom McDermott, N5EG

No, that's what the TAPR folks were saying, and I find that appalling.
BBSs and their users are part and parcel of packet, and I don't see
that changing any time soon, even if some of you are trying your best
to kill them off.

>over radio. That may be the only packet *application* you recognize, but
>it isn't packet radio. Packet radio is a method of exchanging digital
>information, *any sort of digital information* among a cooperating group

Duh.

>of stations. The BBS paradigm was one early application of packet radio,
>but it is no longer a very useful or interesting application of packet radio.

Says you. I say otherwise. I don't disparage YOUR use of packet, and
I don't think you *or* TAPR serves the hobby very well by dismissing
the BBS service as "toys" and no longer useful or interesting. This
is a prime example of my earlier explanation of how the innovators
soon move off and leave a new technology to fend for itself, rather
than sticking around to help move the process forward in the

directions you'd like to see it go.

> Currently, our best option is to use Clover II to establish point to point virtual

Clover too is a proprietary protocol and does not deserve to be
supported. Both firms, SCS and HAL, are using ham bands to test
their commercial modems, and in return they do not give us something
back, such as for example specifications of the transmitted
waveforms. I for my part want to know what I'm transmitting,
therefore I don't use these modes...

> Tom, PacTOR-1 (one) does have error CORRECTION.. It's nothing like
> Packet.. Go to the Paccomm web site and there is a page-long technical

Well, just read the beginning of the pactor protocol description by the
original authors, about the second sentence reads: "pactor unifies the
best parts of amtor and packet radio".

> explanation of Memory ARQ and how it works. The difference between PacTOR

Pactor 1 does indeed implement a diversity combinding scheme called "memory
ARQ". It doesn't work out too well, because they assume the noise statistics
are the same during all the retransmissions, which is not generally true.
Another problem is that many controllers either don't have the hardware
to do it right or have implementation problems (such as saturation at
their A/D converter).

And, secondly, nobody and nothing forbids you to use memory ARQ also on
packet radio (though nobody does it...)

I'm not advocation the use of HF packet radio, on the contrary, I'm
the first one to refuse hacking 300baud modems into my VHF packet stuff,
I'm just trying to get the facts right...

> When I use BMKMULTY software with a RTTY T.U. on PacTOR (no TNC), it has a
I'm not using TNC's either, I have my own DSP implementations...

I've presented arguments to the contrary, which you've chosen to ignore.
Yes, the packet network as you know it may well be dying, but that doesn't
mean that packet radio will be dead.

Apparently you prefer to bitch and complain rather than engage in reasonable
discussion, so I don't think I'll waste any further time on this thread.

>SMTP mailer.

I think you are too tightly focussed on the actual protocols and mechanisms,
rather than the concept of a BBS.
A BBS, to me, is just "a bulletin board system", which I think is just
a machine that stores bulletins, personal messages, and probably files,
for reading by local users and forwarding to other similar systems.

If it is a W0RLI box or a Linux machine with POP and SMTP does not really
matter, conceptually it is the same thing.
When you thing "BBSes are dying" why do you think a TCP/IP system would
survive? It certainly has interesting applications, but to the average
ham sending a message it is just more complicated to setup and provides
no additional utility.

When you want to outline the advantages of TCP/IP, you should mention some
new things made possible by it, not the same old hat that the BBSes

are already providing.

>a program that we've been collaborating on, plus docs, etc.)

>If I have to connect to some BBS, rather than sending it directly to your
>machine, then it has to be stored at the BBS (as do all other traffic) and
>it has to be transmitted again at a later time for you to download it ... it
>would be more efficient to simply place the file on your machine, leaving
>the BBS out of the picture ...

When a direct transfer would have been possible (i.e. not via the network),
it would be more efficient. When it would have to go via the network, or
at least via the local node, there would not be much difference in efficiency.
In fact, experience shows that store-and-forward transfers often are much
more efficient than direct transfers via some less-than-optimal links.
That is why I send most of my mail to the local node (which runs an SMTP
server as well), which will send it to the node where the destination station
is located (using an alias file), and then to the destination station.
This way, all the mail for a user will collect at his local node (much like
a BBS), and it is efficiently transmitted whenever the user is QRV.

>Many other applications come to mind, but it sounds sort of like you
>have the view that a BBS is the answer to everything ... I don't share
>that view and I hope you don't really either ...

I have not said that the BBS is the answer to everything, but that it
will be very difficult to come up with an application that operates when
the user is not present and that could not be provided by a BBS.

>> There also is a paragraph that says that importance of the traffic must
>> not warrant the use of the public telephone system. Maybe that is similar
>> to what you have? It seems to be there mostly to avoid the use of amateur
>> radio as a replacement for (mobile) telephony.

>I personally feel that content restrictions simply impede amateur
>packet radio from becoming truly integrated with the larger world
>of the internet ...

I think this is good.
The same restrictions impede amateur voice radio from becoming truly
integrated with the telephone network, and this has not been a problem

either. (phone patches are not allowed here)
We do not need to integrate our radio hobby with a network that does not
have anything to do with radio.

>In a more ideal world, hams would more universally be competent enough
>that even homebrew gear would be reliable enough to "trust" it in unattended
>operation ... if gear is not that reliable, it's likely to cause interference
>even
>with the operator in attendance ... if the op can't build it to work reliably,
>he's probably not competent to recognize abnormal behavior, short of smoke,
>fire, or complaints ...

But that is why he has to be nearby. To stop transmissions when complaints
come in.
When we installed a packet radio node at a telecom tower many years ago,
a requirement was that we installed a phoneline and modem to remotely
switch of the station (which is operating under an unattended operation
license).

>> (although there are still far too many users who like to see the network
>> as a mechanism for transport of their data, it really is just a big social

>I would find it absurd to expect that the builders of a network would
>not expect that the primary perception of it's raison d'etre for most
>users would be "to transport data" (hopefully in a timely and reliable
>manner)

That is your opinion. But it remains a fact that our amateur radio license
is not intended to provide production-quality radio services to the guys
who happen to have passed some technical exam, but to provide a way to
experiment.

Hi all!

I heard time ago someone had done TNCs using the Motorloa 68000, instead
of Z80s. I am looking for information about them, as I am currently
weorking on inbedded computers.

Cheers

Thanks, guys. I'll wade through this installation
process sometime.
As far as the soundblaster timing problems and needing
special drivers to copy packet....
the PktMon12 program copies packet just fine with the
standard driver. It just doesn't provide the capability
to transmit. This program uses the soundblaster with no
interface to the receiver speaker output other than a
shielded audio cable.

>Doesn't HAVE to be "hardened" ... and reliable backup power can be as simple
>as a good sized gel-cel and a small solar pannel ... doesn't HAVE to cost a
>fortune ...

The reality is that there are many parts of the country where the density of hams, particularly those with even an interest (never mind technical competence) in digital networking is low. Here in northern NH, for example. Where are we supposed to get either the money or equipment and sites? In the upper part of NH (over 100 miles through mountains) there are only a handful of technically competent hams and maybe a dozen additional hams who have any interest at all.

>So the LANs in the areas served need to pony up for the WAN trunks ... sounds
>like an "association" to be formed ... with some membership assessments ...

Are you volunteering to start one? :-) Here we have NEDA (New England Digital Association) but they don't have the resources to fund much of anything, although they have been instrumental in helping to establish technical standards.

>I am *not* saying "it's a piece of cake" or "it's free" ... like most things
>that are worthwhile, it will take some investment of both time and money ... but I still
>believe that it's doable ...

I don't think you've done the math. While it might be do-able in California, think of the large, sparsely populated states with big mountains in them like Nevada, Utah, Wyoming and Montana. If we can't do it in NH, how are they going to do it there?

That said, if you can manage to come up with the necessary funding, I could promise you that at least in NH, we could build a nice HS WAN. :-)

OOPS! I'm wrong about PktMon12. It uses a Hamcom interface
to a serial port. *Not* the soundblaster card. The soundblaster
only does my weather decoding programs.......never mind.

PktMon12 can be found at http://garbo.uwasa.fi/pc/ham.html

(I need to look at the back of my computer more often. No telling
what else is hooked up there.)

3019. ** PacComm PTC-II **

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-04 00:00:00 UTC
From: "Brian K. Short" <ke7gh@primenet.com>
Message-ID: <33959632.1D0@primenet.com>
Source record: 29808

** PacComm PTC-II **

My second-hand (but unused) PacComm PTC-II Multimode DSP Communications Controller arrived and is hooked up. As it was purchased over a year ago and subsequently never used, it had old firmware. I have now loaded BIOS v1.2 and the v2.2 firmware. The upload (or is it download?) went quite smoothly using software available from the SCS web page.

I am quite impressed with this piece of equipment after being disappointed by my last "DSP Multimode" the DSP-2232 several years ago.

The PacComm unit in particular has a very attractive front panel display and case. The greyscale picture on their web page does not do it justice. It is very stylish and compact. (I have pictures on www at http://www.qsl.net/k7on/ptc.htm but a color picture is much needed...)

Anyway, I have been monitoring RTTY and Pactor some today (with FT-1000mp and XPWin -which I STILL need to register) and compared to my PK-232, the Pactor is amazing! I'm even inclined to say that it is far better on Pactor RX than my old P-38. I have not had a chance to evaluate weak/noisy copy on RTTY as yet (the P-38 did quite well), but I hope to next weekend in the ANARTS RTTY contest.

I have 512k memory in the PTC-II and no accessory modems for packet. I'm interested in any accessories others have added?

I have not yet connected the tranceiver interface. Will it work with my FT-1000mp (which has RS-232 input)? Are the frequency UP/DOWN signals just as useful?

One weak point is the year old manual. Is there a newer manual available? Where? (I just like manuals!)

I was reluctant about this equipment based on price, but so far it is my favorite multimode and my favorite DSP communications controller.

I'm not sure why I haven't heard more praise of the PacComm PTC-II anywhere? ** I LIKE IT VERY MUCH!! ** It has a happy home...

Hints? Tips? Ideas? Scheds for Pactor-II?

73, Brian** PacComm PTC-II **

> >has a future and is interoperable with the Internet.

A good choice ...

> And no future at all, without Internet. That's because TCP/IP is worthless
> for wide-scale amateur radio digital networking.

What absurd contentions ... where the hell do you get such outrageously
inaccurate and unfounded ideas??? (this is right up there with the Morse
Myths ...)

> Without the telephone, the
> parasitic "amateur TCP/IP" will do as any other parasite does when deprived
> of it's host. It will wither and die.

This is ridiculous ...

> Hence the urgent desire by people who care more about TCP/IP than they do
> about amateur radio to legitimize "radioless Ham Radio", and "Internet
> Forwarding".
>
> Pathetic, isn't it?

What's pathetic is that you can't see the merit in being compatible with
the world's defacto standard protocol stack ...

> What a paltry vision that includes nothing better for packet radio than to
> be a parasite hanging off of the Internet instead of the proud, independent
> ham radio digital network we have today. These people are really a bit TOO
> radical.

Parasite, my ass ... amateur packet radio should be a vital *part* of the
internet ... do you consider your arms to be parasites???

> ><sigh...> If you can point me to a newsgroup or Internet-compatible
> >e-mail address to do so, I will consider doing so.
>
> Let's see... Steve has an extensive "packet radio" network, but can't post
> a message on packet unless he can find the appropriate Internet
> newsgroup....

No, he simply asked for "an intenet-compatible e-mail address or newsgroup."
I see nothing outrageous in that request ... it's your stupid BBS collection
(I reserve the use of the word "network" for something that *deserves* that
name) that is out-of-step with the rest of the datacomm world ..

> Pathetic, huh? This guy must really be "Mr. Packet Radio", like Greg
> Jones, who also is NEVER seen on the packet radio network.

Correction, that's not "packet radio *network*" that's "collection of BBS
systems" ...

> Amateur Packet Radio is just not "good enough" for Greg and Steve, I
> suppose. Phil Karn, either.

Amateur Packet BSS systems, as a whole, are "not good enough" for
much at all ... the same "stay buried in the dark ages" mentality that
drives the "jam Morse down everyone's throats forever" crowd is quite
apparent in your rabid bitching about folks who are trying to promote
some progress in ham radio in spite of the backward nature of the bulk
of today's hams ...

> >> Yep. We're evolving to the telephone, and Ham Radio is going the way
> >> of the dodo bird. Our bands will soon follow.

Our bands will be sold off if we don't start doing something useful with
them ... your BBS systems are so archaic as to be virtually useless ...

> >Use of the Internet does not equate to using the telephone.
>
> Gee, what a clever statement for the TAPR NETSIG chairperson to make!
>
> >In the case of the Puget Sound Amateur Radio TCP/IP Network,
> >bring we bring TCP/IP on RF right to the Ethernet of a Seattle-area
> >Internet Service Provider. No telephone lines involved.
>
> "No telephone links involved" in Steve's hookup to the telephone. (ISP)

"ISP" does NOT equal "telephone" ... if you read what he said, their
radio system gateways directly to the internet via the ISP's ethernet LAN.

> What a proud moment for amateur radio.. (yawn)

You simply attempt to disparage those whose efforts to provide more
modern, useful services overshadow your outdated, limited accomplishments.

> >The ISP uses multiple Intenet backbones, with redundant connections.
> Their data center is fully earthquake hardened and capable of running for
> days on generator power. Again... no telephone lines involved.
>
> Another "Internet doesn't use telephones" claim from TAPR's networking
> expert. Boy O Boy!

The point of interfacing to the internet is that "that's where the information
is."
That that excapes you speaks volumes about your awareness of the modern
world and what has become the minimum standard of usefulness ...

>3. We object to hams who advocate using the telephone
> in preference to building new radio links.

>It's that simple.

OK. Good outline. Now why do you think this? In particular, why
is is ALWAYS the case that a ham should NEVER consider using
landline links to bypass existing or potential radio links. (I may
be reading absolutes that aren't there, so please correct me if so)

I would think that as technically minded folks we would get head-to-head
and on a case-by-case basis look at:

Reliability of the two approaches in that particular application

Availability/willingness of someone on the ground to keep
whichever approach running.

Appropriateness of the selected method for the anticpated
traffic at either end.

Support for existing installed base of services if they
are sizeable (That's a relative term. Could only be handful
of folks in a small community).

General impact on the state of the Ham community in which
the link is deployed. (This is where we weight the
"moral fiber" justifications)

What I hear from the so called landline lids is that they did such an
analysis in certain cases and decided to use a phone line while at the same
time working on another approach to radio links that might replace it in the
future. That last one is a bit of a value call, so honest folks will
disagree. Impugning all kinds of disingenious motives to someone who gives it
less weight that you seems a bit much. In any event, it is a local
issue not a TAPR issue. (BTW, you and I are in the same area so
I look forward to joing the discussion on the packet network when I get
my call and gear in a few weeks.)

That's exactly the reason why idiot half-duplex nodes of the
"classical" kind are stupid and inefficient ... replace it with
a bit-regen full-duplex repeater and your hidden terminals
will go bye-bye ... read my original statement, it's all there ...

> When north central Montana had a single node in the Sweet Grass hills - it

It seems that what is really being objected to is ANYTHING that connects
the ampr.org domain to the rest of the internet, since that allows the ampr.org
domain to become a vibrant part of the global internet ... that clearly
threatens
the hell out of the "Packet God" status of the lowly BBS operator who can't
provide ANYTHING like the services that are available with *REAL* networking
techniques ...

Looks pretty slick ... I can imagine the sour feeling in the stomachs of the
BBS dinosaur folks when they see someone doing REAL networking ...
they must feel like a deer in the headlights of a Mack truck ... that they
insist on screaming "trucks are bad" when they should have the sense to
concede dominion over the highway is laughable and sad at the same time ...
however their feeble attempts to hide their impotence are pathetic ...

I use DOS and Win3 and home and Win95 at work, so I can't specifically address your Win95 problem. But RITTY does not use the DOS sound card drivers--it talks direct to the hardware. I noticed that it worked best if I did not load the drivers. I had a crash when they were loaded high, so I took them out (I only run one program in DOS that needs sound card drivers, so I can always put them back in when needed).

I haven't tried RITTY with the drivers loaded low. And I'm not a contester, so I don't use WF1B's software. But when you use the two together, you are running RITTY as a DOS TSR, talking to a DOS program, and the combination may step on something in Win95.

You might want to make a separate DOS prompt Icon for RITTY, and play with the "Memory" and "Misc" settings in the icon's "Properties" tabs. In particular, in "Memory," try setting conventional memory to "640" and click the "protected" box underneath the number. Set EMS, XMS and DPMI memory to "none." In "Screen" turn off Dynamic Memory Allocation. In "Misc," set "Idle Sensitivity" to "Low." This is all standard stuff for getting DOS programs that talk directly to hardware to behave.

Also, get the latest version 2.07, and read the section about Win95. It's on the first couple of pages. You can download it from:

http://www.megalink.net/~n1rct/rit2/rit_dl.html

It's best to install dual boot to DOS 6.2x or Win95 when you first install Win95. It is possible to retrofit your Win95 system to dual boot system. You might want to talk to a computer expert in your area. It involves copying a DOS directory, monkeying with several hidden system files, and a couple of INI files. I've done it, but there's no way I could write it down without several hours of work. I don't think you need that.

If the RITTY/WF1B combo is stepping on something low-level in Win95, it
may be best to boot the computer in MS-DOS mode to run RITTY.

RITTY should work fine then. Under a boot to DOS 7 (Win95's DOS), there's
none of the Win95 virtualization of the machine that there is in a DOS box
under Win95. Just go to the shut-down menu, select "Reboot the computer
in MS-DOS mode, and click OK. Try that until you get your Win95 DOS box
for RITTY set up properly.

Also, if you're closing the DOS box in which you're running RITTY as a
TSR, you've just made it go away. Files may be left open. Then when you
bring up another DOS box, you're running WF1B without RITTY. That ought
to confuse things! Be sure to leave the DOS box up. Also, play with the
"Background/Always suspend" checkbox. It may be that RITTY doesn't
like being suspended when in the background.

This is all educated guessing. Ask Brian to be sure

>global Packet RADIO BBS forwarding network? Try to get a direct answer on
>that one, some time.

I don't know about Greg, but I have long ago lost interest in any
long-haul "packet radio _BBS_forwarding_ networks" simply because the
transfer rate is very limited and above all, since the latency times
are far too long for any interactive or task-to-task applications.

What alternatives are there to build a truly usable global packet
radio network ?

Using a geosynchronous satellite with a wide enough transponder would
be very nice, unfortunately, the Phase 4 satellites are far in the
future and it is unclear how they would be funded.

Using HF would be an other alternative. However, even if all amateur
bands were used for packet radio backbones only, you still would have
to be extremely careful about frequency reuse on all those bands that
are usable at a given time. For example for short (less than 1000 km)
daytime links 160 or 80 m should be used to prevent the signal from
propagating longer than intended coverage area. Automatic power
control will help to reach this goal. Spread Spectrum is an
interesting frequency management tool, which is more flexible than
static frequency allocation when the conditions on the bands are
constantly varying.

However, to run a large number of 56 kbit/s backbones around, you need
a certain amount of spectrum, whether SS is used or not. You can do
some trading between bandwidth and SNR (and hence transmitter power)
with different modulation methods, but if we look at it from a global
network management standpoint, there is a limited amount of user data
that can be transferred over the current bands at any given time.

The previous analysis assumed that all HF ham bands were allocated to backbone traffic, but in practice, only a small part of each band could be used for packet backbones, thus, the use of HF as the medium for packet backbones is even more unrealistic.

So the only alternative seems to be to use some land lines (telephone/Internet) for building a network that could be used for new application and not being limited to mail and bulletins forwarding.

In response to Charles Brabham's multi-faceted attack on the TAPR president:

It seems you want to eliminate TCPIP. Why? None of reasoning has been good enough yet. I myself am working on a quick/dynamic connection protocol that will conquer the mobile problems of access to nodes (it will be someone else who works out high speed hardware, hopefully we will see the hardware from tapr soon). It seems like you only want IP to go away because the software support that you want isn't there. I can only give you my solution on that one . . . roll your on, debug it, prove it to ham buddies, listen to their ooes and ahs, and push it like mad with brute force provided by good reasoning. If your solution is a good one, I still cannot guarantee it will be accepted, but I can guarantee that you will get more respect than all the flack that you are going to get for attacking the president of TAPR on grounds that he isn't developing the correct software fast enough for you to use, or worse yet shutting down IP experimentation for the same reasons.

Sincerely,

You should think about what you are saying. Cutting off TCPIP and the Internet from HAM radio would be worse for HAM radio then anything I could ever imagine for the hobby. Imagine telling little Johnny, "Hey, Johnny, log onto the local node and wait 10 hours for someone to chat with. While your at it, compose a piece of email that will never make to your penpal on the coast. I'm sure will find ham radio very interesting with all these ways to do nothing on all those BBSs. Interacting with machines across packet has to be the most interesting thing since Jurassic Park. Imagine all the fun!". Kids are not much into talking on the radio, but they are very interested in talking on the internet, as most families have a computer ready in the waiting.

Another thing, you seem to be attempting to ram your opinion onto the internet much like you did to the BBSs that the TAPR officials noted, that is, by expressing your opinion in sheer volume. Sorry, you can only tire people out, you will never trully push your opinion on them.

And on to proud and independent . . . thats why I always here people tell me "packet is dead cause there is nothing to do with it." It burns my soul, but I know that from their point of view, that is the absolute truth. Mail doesn't flow properly, file transfers are useless at 1200baud in todays world of mostly windows users (where most everyone is at). Linux needs more push in the ham community, but once you download a good package for linux over 1200 baud, the same the effect results . . . grey hair and crawling status bars. If you are "proud" (and it probably was great a few years ago) of this in todays world of DSP, cheap electronics, and tons of networking software, then you shouldn't be a ham. Get some radio shack 49MHz walkie talkies and use that band for your packet. The rest of us want to move on, and do some really high tech stuff, which is what amateur radio is all about.

Later,

If the FCC came to your house and asked you to justify the billions
of dollars in frequency you are operating in, what would you tell them?

Would you give them an answer, or would you tell them why the boogie-man
GJ is scaring you? Keep to the subject. What do you have to offer to the
U.S. citizens that justifies our trust to you of billions of dollars in frequency
allocations?

What can Ham radio offer Joe and Alice citizen, that they can't get from
capitalist methods? What socialist function do you offer, that is great
in principle, to justify this welfare?

My own feelings on the matter, is that Ham radio is dead. I say give them
1 MHz at 144 MHz to 145 MHz and sell the rest. The reason I say that, is
that there is no justification for the present allocations. There is no advancement
over what was done in 1967. Give them a band to do simplex FM and shut the
rest down. When I listen to the fights and foul language all night and day, I say
enough is enough. Let's give it to someone who can build something, rather than
these piss-ants who want to put up YABBS (yet another BBS)...

In that regard, TAPR has done more for Ham radio than the small minds of BBS
"sysops."

Steve

> maybe a dozen additional hams who have any interest at all.

Sounds like a dozen plus a handful to me ... that's enough of a core group to
fund a node ... surplus UHF mobile radio gear is cheap and will support 9600
with minimal mods ... for not too much more, you could run 56k ... go to
your XYLs and say "honey, I *really* want to get involved in something very
interesting, would you mind terribly if we didn't go out for dinner this Friday
so
I could divert that money to something that's important to me??? If she's
worth
having and gives a crap about you, she'll understand and say, "sure sweetie"
or something to that effect ... (after all, you don't pull this on her every
week,
right?)

So now you've got a dozen plus a handful that's 17-18 folks to chip in ... at,
say, $60 each that they would have spend on that Friday night restaurant
dinner and drinks ... that's (18*60)=$1080 that you can collectively invest in
your node ...

Plus, you have the mountains to provide a high site ... Mt. Washington is
rugged, but covers a lot of area ... put together a plan outlining what your
node will require in terms of space and power and what benefit it will provide
and make a proposal to the agencies who have space on the mountaintops.
Surely someone will bite ...

> >So the LANs in the areas served need to pony up for the WAN trunks ...

> mountains in them like Nevada, Utah, Wyoming and Montana. If we can't
> do it in NH, how are they going to do it there?

Big mountains = good sites for wide area coverage ... couple that with a sparse population and it can work fairly well ... the problem is when people insist on using "high sites" in densely populated areas like LA where hidden terminals become a problem when not running full duples repeaters.

> That said, if you can manage to come up with the necessary funding, I
> could promise you that at least in NH, we could build a nice HS WAN.

<Much deleted>

Thanks for jumping in here, Hank. I've been in a rather awkward
position here, since I've been arguing a point of view that I do not
necessarily endorse. I've seen quite a bit of one side of this issue
from you and N5PVL, and was merely trying to get "the rest of the
story." One of the respondents asked me to post more questions, since
I indicated that I wasn't entirely happy with the answers I was
getting. I'm not really comfortable doing that, because it involves
paraphrasing my understanding of the arguments of others. I was going
to post a recent packet bulletin from N5PVL, but that might easily be
construed as inciting a flame war.

I'd urge you and N5PVL to lay out your case here, and TAPR and other
interested parties to present their viewpoint. I think we could all
benefit from this. I, for one, can see some benefits, as well as
drawbacks, to use of the Internet for exchanging BBS traffic. We're
completely isolated from the rest of the packet world here, and there
seems to be little chance of that changing anytime soon.

I started playing with linux since Linus first offered it for ftp and I
have been a devotee ever since, the way it has advanced still amazes me.
I couldn't see any other outfit putting AX25 into their Operating
System.
Like you I do everything on a linux machine, work and play. The
dosemu(lator) and Wabi and Wine allows me to handle the EXCEL, Word6 and
PowerPoint stuff I get thrown at me. All this with no rebooting, all my
other stuff like X3270 via ppp into our Corporate mainframe and pdf docs
work fine.
Regards

> partly because the high volume, high speed "connectivity" it requires
> cannot currently be provided with radio links.

And there we have it. TCP/IP is too demanding on HF bandwidth and
reliablility.

Native HF transmission media (e.g. Clover and Pactor) together with
'efficient' AX25 BBS forwarding protocols make much use of fitting the data
and the message to the circumstances, and I take my hat off to those
involved in these fields. Maybe these people can indeed bring back traffic
from the AX25 network that is currently being delivered over part of the
journey by non-radio means ?

As Charles points out, TCP/IP connectivity 'cannot currently be provided
with radio links'. It is somewhat a credit to the amateur community that at
VHF, UHF and Microwave, Radio amateurs are able to adapt and experiment with
RF technology to actually transmit TCP/IP frames 'over the air' at these
frequencies, and where there is plenty of bandwidth to satisfy the hungry
demands of the protocol in use.

Perhaps radio amateurs involved in using TCP/IP at VHF and above recognise
that:

1) HF bandwidth is precious ?

2) HF is best used by efficient protocols more suited to the task ?

3) There is a real threat to goodwill from non-packet radio amateurs by
swallowing up more and more HF bandwidth for 'packet' ?

4) Their efforts are best directed at improving and experimenting with
VHF and up 'short-haul' technology. Adapting the Radio, and the modem

driving the Radio, spurred by the unyielding demands of this particular protocol ?

As to what will cause the death of packet:

Are most packet users more interested in packet radio technology or the 'applications' that they find on packet radio itself ?

Yes. The message is that the internet is very useful to those of us
who have it. But it's not ham radio, is it? In fact, if one has
access to the Internet, what incentive is there to use Ham Radio at
all? The only thing packet has to offer is experimentation and lack
of all the spam, UCE, porno, and bad language we find on the 'net.

>the more popular mailing lists find their way to most of the movers and
>shakers.

But it's not getting out to the rank and file that you'll need if you
want any chance of new ideas getting the mass support needed. In the
meantime, those who present the anti-TAPR agenda go unanswered, thus
damaging the TAPR image further.

>>Deliberate or not (and your comments above make me wonder about that),
>>the net (heh) effect of promoting the Internet to bypass RF links IS
>>detrimental to development of a viable RF network.
>
>I disagree. In my view, an all-RF WAN can never be viable. What we need

It certainly was a few years ago. If you promote substitution of the
internet for an RF WAN, you've just created a self-fulfilling
prophecy.

>>Boring is in the eye of the beer holder. The ratio of Signal to Noise
>>is far worse on the Internet than on packet radio. We just have

>good example of the latter :-). With a little selectivity and the many
>software tools available, you can access more high-SNR material than you could
>ever hope to keep up with. In my experience (which is substantial in both

Irrelevant. It's still mostly noise. The fact that there's also some
signal doesn't affect the ratio. Ham packet has none of the stuff
I've listed above (spam, etc) plus, with a bit of software tweaking,
you can pick and choose your "signal" from the bulletins almost as
easily as you can on UseNet.

>cases - I've run a PBBS for more than 10 years, and I've had Internet access
>for about 10 years), there is just no comparison - the Internet apps leave

Which proves what, exactly, in the context of this discussion? You
don't seriously expect anyone to challenge this, do you? ATV leaves
Internet video in the dust, and ham repeaters leave Real Audio in the
dust, too, if you want to compare apples and bananas.

>>It's faster, different, and unregulated. It's no more or less
>>"fascinating" in and of itself. Set up the equivalent of an IRC net

>>old resistance by the Luddites, of course.
>
>Where've you been? The IRC-like global ham radio "convers" network has been
>operating for years. For some packet users, it's their favorite packet radio

Not around here. We have the chat nodes, but after the initial
flurry, nobody uses them anymore. I'm talking about programs that
would reside on the users' computers, complete with as much as
practical of the IRC stuff like wav files, color support, etc. Is
that available on the net for me to download and try out?

>application - it's not unusual to see 100+ users in 15-20 different countries
>online. The Internet gateways are instrumental in providing the connectivity
>for this network, but most of the users access it by radio. Similarly, HTML
>(and even digital audio and video) is very common on packet in areas where
>higher-speed MANs have been implemented.

If you have Internet access, I fail to see the point in using ham
radio. Why not just use the net? I don't see much point in hooking
up my ham rig to the net, when I can just dial it up myself on the
phone. I suppose in countries where net access is very expensive or
not available, it might make sense to do it the way you mention.

>
> Phil G4ZOW/M

I've had lots of trouble finding circuits. Some manufacturers used to include a circuit with the monitor handbook - which is usually thrown out with the original packaging by the owner!

Try looking this WEB site for lots of good info on repairs, components, other info sources:
http://www.paranoia.com/~filipg/HTML/REPAIR/

Some manufacturers (and even repair shops) now have limited service info online. Some are even searchable by monitor type and fault description. They are pretty trese though, like Dead monitor - check R234, etc. Try this one:
http://www.anatekcorp.com/monitor.htm

Some manufacturers like Zenith regard monitors as disposable items and only repair by replacement!!!!

Good luck,
Mark Harrison

I don't suppose anyone knows of a program/kernel/etc. that will
connect to a Netware 2.12 server? (I know about ncpfs but it appears
to only support NW3 and greater)

Is Wine now reliable? I've got a copy on a Yggdrasil CD set I bought
at Dayton last year but it warns in many places of instabilities in
Wine. Right now, I'm planning on simply setting aside 25% of my hard
drive for a DOS/Win3.11 partition. "lodlin" works great, allowing
easy switching between OSs, especially with the DOS partition mounted
on the Linux side too.

3041. What Greg Responded to:

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-05 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.com>
Message-ID: <01bc716c$5ddcf660$247141ce@n5pvl>
Source record: 29641

Posted to TAPR BBSSIG:

The following concerns the "tcp-group" Internet discussion group formerly operated by Brian Kantor, (The "owner" of the amateur TCP/IP "network") and
the "BBSSIG" Internet discussion list operated by TAPR.

I have recently been attributed with "shutting down" the tcp-group list, though it is not clear how I was supposed to have done that. I certainly disagreed with many of the attitudes I found there, but mere disagreement can only stimulate a vital, ongoing discussion. Only stagnant, aimless discussions and ideas break up easily when exposed to simple disagreement.

This is why Hank W0RLI and myself are Censored from the TAPR BBSSIG list. The clique of "Internet Forwarding" advocates who have taken that list over and chased off the real Ham Radio BBS SYSOPs are terrified of any form of disagreement.
Hank and I pointed out that as Packet Radio BBS SYSOPs we should of course be using Radios, and these "hams" found that concept to be intolerable.

Hank wanted to know if "advancing the use of the telephone" was included in (Tucson Amateur Packet Radio) TAPR's charter...
Greg Jones WD5IVD (President of TAPR) didn't like the tone of THAT question, and immediately after, both Hank and I were Censored from the TAPR
BBSSIG list.
For my part, I hadn't made ANY postings to the TAPR BBSSIG for several days at that point. I was Censored along with Hank, simply because it was known that I disagree with Greg Jones in his insistence that as hams, we would all
be better off using the Telephone with TCP/IP, than we would with Radios and
anything *other* than TCP/IP.

There is a rumour now which says Greg is crawfishing on this issue with a will, trying to place blame of TAPR's censorship on some mysterious "group"..
Let's see..
Greg Jones is not only president of TAPR, but a member of TAPR's Board of Directors as well.. Which "group" is it, I wonder, which has more authority within TAPR than Greg Jones? No, there's no doubt as to "who" is currently running (and ruining) Tucson Amateur Packet Radio.

Hank's question about TAPR's charter IS interesting, isn't it? If TAPR's charter is to advance Amateur Packet Radio, how does Greg Jones justify tying up TAPR's resources and reputation with his personal quest for

"Radioless Ham Radio", and 'Amateur Telephone", ect., in order to prop up amateur TCP/IP?

Amateur TCP/IP has proven to be unable to even experiment with, much less emulate the sort of long-haul amateur radio links which are vital to our global ham radio digital network today. For this reason, amateur TCP/IP is literally no good for amateur packet radio networking of any significant scale. It is a failure as an amateur radio application, partly because the high volume, high speed "connectivity" it requires cannot currently be provided with radio links.

This is why there is no global amateur TCP/IP digital radio network at all, and it also the reason that amateur TCP/IP fanatics are alone in the amateur
radio community in promoting and seeking to legitimize "Radioless Ham Radio",
where they depend on telephone links to provide long-haul communications, *pretending* that this is ham radio by referring to the telephone link as "advanced amateur radio networking", "Internet Forwarding", ect... It's a sick attempt to prop up amateur TCP/IP while damaging mainstream packet radio,
and directly contrary to the best interests of the amateur radio community.

Greg knows his ideas and actions cannot stand up to close examination, and would be laughed down in a free, open debate. He is terrified now of seeing these matters openly, publicly discussed, and with good reason. He knows he is in the wrong.
Hence the frightened, cowardly Censorship to be found at TAPR, in defense of
actions which are detrimental to the amateur radio digital community. (Internet Forwarding)

Now, take a look at these last few postings to tcp-group and judge for yourself as to why the tcp-group list REALLY shut down.

------------------------ First Quote: ------------------------------

OK. I KISS-ize my TNC (if possible), buy a cheap old computer, obtain a copy of one of the seemingly infinite variations of NOS, get an IP address, and after a few wasted evenings call up a friend and get her to come over and help me install it. Then what can I do?

Telnet to a BBS.

Great. Really great.

There are at least two problems here: it's too hard and the rewards are too few.

Installing and configuring IP could be made much simpler. Wired networks are now using address negotiation (via PPP), BOOTP, DHCP, etc. to make configuration automatic. We're still assigning static addresses. There's little flexibility and no support for mobility. It's a pain for the person

assigning them and it's a pain for the person using them. If the software were "plug and play" more people would at least give it a try.

The second problem is that IP offers little advantage over AX.25 or other packet protocols. Sure, one can telnet and ftp at the same time (which would, of course, when done on a 1200 b/s link be sure proof of insanity) but is that really what users want? The really growing parts of packet radio are APRS, DX Cluster and Converse nodes. Do these exist for IP? Where are even better applications?

A third problem is that things don't work. Radio-based IP breaks some crucial assumptions that are fundamental to the protocol stack design. We haven't fixed those yet. An end-to-end connection is often difficult and in some cases impossible to obtain. In almost any comparison the BBS forwarding network puts the IP network to shame -- it may be slow, inflexible and technically not very sophisticated but at least the BBS network delivers messages!

Sorry to be so negative, but I see major problems. If IP is to succeed on the radio it needs to be easy to install and configure, offer at least the same applications as available via other means and preferably more, and work as well or better as other protocols and networks.

Jeff, k9ja

---------- And Finally.. ----------

I suggest this list has served its function. In the last two years it has had zero substance, and before that was dedicated to converting NOS to a BBS.

I think it's time to pull the plug.

Steve Sampson (No callsign given)

I didn't shut that list down. It shut itself down, and rightly so.

Thanks for taking time to look and think this over. I figure since Greg Jones is "big enough" to attempt to stifle other people's differing opinions, I'll be "big enough" to tell my side of the story whether Greg Jones likes it or not.

I don't "goose-step" in line with ANY cowardly censor. If Greg Jones thinks censorship is so wonderful, I'm sure there are places he can go where it is considered to be normal, acceptable behaviour... Or have all of those little communist dictatorships dried up by now?

No matter. I'm sure that if Greg looks long enough and low enough, he'll find a place where his behaviour is considered to be perfectly acceptable, and the general population there will accept Greg's idea of arguing an issue (undercut and censor those with opposing views) as the way mature, responsible and decent adults deal with opposing viewpoints.

In an earlier posting, I suggested that this list is made for Amateur Radio BBS SYSOPs, not "Internet Forwarders" who's actions are destroying that very same BBS forwarding network we are allegedly here to discuss and promote. I invited them to take a hike.
Today I am suggesting that if Greg Jones wants to take a position of protecting those who are actively working to destroy the amateur packet radio BBS network, that he is quite welcome to "take a hike" as well. Those actions denigrate TAPR, and Greg's office within TAPR.
Hams will never feel the same about the president of TAPR again, now that Greg Jones has used his office to protect and promote the "Internet Forwarders" who are currently vandalising the BBS network.

Greg has perverted this forum into becoming something directly contrary to it's stated purpose. He has turned this list into a refuge for the very people who are currently destroying the amateur packet radio BBS forwarding net. He protects them at every turn.

Why?

That's a good question! I'll ask the question Hank Oredson asked, once again...

Where in TAPR's charter does it call for us to "advance and develop" the art of using the telephone? Isn't TAPR suposed to be an Amateur Radio organization?

If not, TAPR, then please change your name, charter, and logo to reflect that.

If so, TAPR, then please change your "policy" and your "leadership" to once again reflect your charter.

The membership were told they were supporting Amateur Packet Radio when they paid their TAPR dues. - Not "Amateur Telephone". They most certainly were not told their money would go to promoting the vadalization and destruction of the Packet Radio BBS forwarding network, and to protecting those who participate in that vandalism.

Greg Jones is digging a deep hole for himself, coming out of the closet as a "LandLine Lid", and Censoring anyone who tries to speak up for Amateur Radio. The other folks at TAPR need to think about whether they are ready to jump down in that hole along with him...

3042. Why I say Greg is a LandLine Lid. (Because he is)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-05 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.com>
Message-ID: <01bc716e$c54e1020$247141ce@n5pvl>
Source record: 29642

Greg Jones denies being an "Amateur Telephone advocate, says the Internet Forwarders he
protects on the TAPR BBSSIG are just good old boys having fun, ect.. He wants me to point out where he has advocated replacing radio links with telephone links..

OK, it's in here. Read this, and see why I might call an Internet Forwarder a Jerk, ect.
Not to mention the kind of "ham" who is capable of promoting such activity.

A few hams have expressed disbelief that there is actually any organized effort to destroy the global amateur radio digital network.

Here's a few quotes to consider:

========== Example #1 ==========

Greg Jones WD5IVD (President of TAPR, formerly of TPRS) from the 8-96 issue of the Texas Packet Radio Society's Quarterly Report:

WD5IVD:
>Some might say that I have just made a pact with the 'Dark Side of the
>Force' by saying we should use wirelines and the Internet to connect regions
>in Texas, Arkansas, and Oklahoma and the U.S. at high-speed. My answer is
>no, we don't turn off the existing TexNet backbone, but use it for what it

>is good for, that of providing long-haul RF paths when our primary
>high-speed routes die.
>
>Many might say that the commercial wirelines are unreliable; however, the
>commercial world is learning every time there is a disaster that takes their
>equipment off-line. Soon, many commercial systems will not be affected by
>earthquakes and other such natural disasters.

Here Greg says that he intends to route around the entire TexNet Packet Radio network with commercial telephone links. He generously allows as to how packet radio could serve as a "backup" for the telephone, then goes on to explain how unlikely it is that it will be needed even for THAT purpose.
(In HIS opinion)

What Greg doesn't mention is how rapidly the TexNet high-speed packet radio network (TX, OK, AR, MO) would disappear when support is withdrawn as he insists on doing. He doesn't mention this, but he certainly knows it.

He just doesn't care - and That says it all, folks!

The many dedicated hams who contributed their time, money and thought to building the TexNet packet network should be aware that the president of TAPR intends to route around their VHF/UHF ham radio links with Internet and donated fibre optic links so that their high-speed nodes will no longer be used, supported, or needed.

TexNet! Wake up! Greg Jones intends to replace you with Amateur Telephone!

This is just a suggestion, but; How about replacing Greg Jones instead?

========== Example #2 ==========

Phil Karn KA9Q (Author of NOS) in response to my statement on the tcp-group SIG concerning:

Subject: Re: 2300 MHz band reallocated

N5PVL:
>>Many *NOS stations are now set up for the single purpose of misusing
>>Internet as a cheap, dumb way to avoid the use of radios. Internet message
>>forwarders are the best known example of this.
>>
>>We can't really afford that type of stupidity any more, IMHO.

KA9Q:
>Why is this stupid? Many people outside ham radio would consider it
>more stupid to build a radio network that uses precious spectrum
>instead of using existing fiber facilities with much greater capacity
>and lower cost.
>
>I feel that radio spectrum is too valuable to waste on point-to-point
>links that are better implemented with non-radio facilities.

Here Phil tells it as he sees it.. The global amateur radio digital network is a "waste of spectrum". He seems to share Greg's belief that we would all

be better off (as hams?) using the telephone.

I can see where Phil would be interested in the opinions of those who are "outside of ham radio". Obviously that's where he's headed (or coming from) himself.

Unfortunately, many Amateur TCP/IP enthusiasts have been exposed to Phil's thinking for years and parrot variations on his line of propaganda at every opportunity. This is one of the main sources of the present knee-jerk disdain
for the amateur packet radio network as expressed by many *NOS users.

*NOS users, by the way, are the folks who set up the Internet Forwarding gates which are currently destroying the amateur radio digital network by systematically "routing around" the existing radio links with the telephone. These hams denigrate the BBS forwarding net at every opportunity,
then insist on being a "part" of it with Internet Forwarding.

(Elbow in rib to Ham BBS SYSOPs..) Get it, buddy?

My feeling is that if Phil Karn's followers do not like the packet radio network and want to do something different, there is certainly nothing wrong
with them doing so.
This does not mean that it is acceptable for them to engage in activities designed to damage or destroy the amateur packet radio network. Hams are supposed to avoid activities which tend to lessen other's enjoyment of the hobby, and amateur TCP/IP devotees are not excepted from this. They are still hams, and are still expected to behave as gentlemen.

If Amateur TCP/IP (NOS) can only work if the radio network is destroyed and replaced by telephone links, then as hams we simply do not need TCP/IP.

That should be obvious to anyone who cares about hams and ham radio.

==========

Greg and Phil sure are impressed with the commercial communications outfits,
aren't they? On the other hand, they don't appear to care much for hams using radios.

Are these really the attitudes we want to see in our "leadership"?

My feeling is that our leaders should be persons who are impressed with what HAMS can do with RADIOS, not what the commercial wireline outfits do.

Both Greg and Phil often are featured speakers at important HAM RADIO functions such as Dayton, and Ham-Com. We hear a lot of this anti-ham talk from both of these guys, and their clique of followers.

I think they all should hear from hams in return..

How about "Booo!" and "Hisss!" ?? -- Right off the speaker's platform!

Should we REALLY hesitate to be rude to "hams" who insist that we should use
telephones instead of radios, especially in the case of those who are supposed to be "leaders" of the amateur packet radio community?

Remember that as featured speakers at these functions, their anti-ham rationalizations are taken seriously by many new, uninformed hams who then feel encouraged to spread the "Amateur Telephone" gospel themselves. Every time this occurs, amateur packet radio is degraded and divided a bit more.

Greg Jones, Phil Karn, and others of their ilk work to "normalize" a concept

which has no place in amateur radio.
The attitude of: "The telephone works better than the radio, so we'll just use the telephone and PRETEND it's a radio."

There is certainly no reason for responsible amateurs to stand by and see this sort of thinking being spread among impressionable new hams.

Much has been written concerning the crisis which amateur packet radio is currently weathering. The competition from the Internet is often put forward
as being our main problem, but actually that isn't the case.
As long as we have "leadership" who is more interested in dismantling the amateur radio network than in building it, it really doesn't matter what other problems we may face, does it?

Our main problem is a lack of worthwhile leadership. We need to fix that first of all, before we can rationally hope to fix anything else.

We are losing spectrum, and losing (link by link) the global amateur radio digital RF network to Internet Forwarders. (Amateur Telephone)
It's time for hams to stand up and put a stop to this vandalism of our network and spectrum, and stop supporting "leaders" who obviously have an "agenda" to follow which is not in the best interests of amateur packet radio.

We need leaders who are part of the solution, not part of the problem.

We need fighters, not quitters.

First and Most, our leaders need to be Hams.

If you are sincerely interested in the welfare of the amateur radio digital network and it's community, please step forward to provide the leadership and direction which amateur packet radio needs at this time.

I for one would find it very refreshing to see a leader in the amateur packet radio community who can display the dedication, wisdom and backbone which is needed to guide us AS A HAM.

Step up! Be a ham! You CAN make a difference.

It makes sense if it's there to be used -- It isn't, though.

If Greg was saying " We'll build this new SS network, and it will work so well that the old stuff will no longer be needed", I'd be all for it. -- Knock it out!

He's not saying that. Greg's saying he wants us to depend utterly upon the telephone and TCP/IP for the bulk of our long-haul "packet radio" communications during a mystical "interrum period" when everybody will allegedly be putting up new SS systems which do not currently exist. (Yes, there are prototypes - but that's all)

Whenever questioned about his LandLine Lid promotion, ect, Greg ALWAYS brings up Spread Spectrum, as if he invented it himself. It's an experimental system which, like amateur TCP/IP, has yet to be proven as an amateur radio application. (Yes, it has promise - but that's all) There is no easily available and usable SS gear to be had at all.

I'd say it's a bit premature to scrap the last ten years+ work in exchange for utter dependence upon the telephone, just on Greg Jones' sayso that his vapor systems will solve all of our problems.

I figure that if SS is better, then people will build it. That's great.

Greg doesn't mention anything about long-haul communications using Spread-Spectrum...
Let's see..
If SS over HF was a "golden bullet", and would be so much better than CLOVER or PACTOR, then why not just build the systems and let their performance sell them? Why this protective attitude over the "Internet Forwarders" populating the TAPR BBSSIG? (Folks destroying the global RF BBS forwarding net by replacing the Radio links with Telephone links).
Could it be bacause Greg doesn't EVER plan to pursue the replacement of our long-haul RF net, once "Radioless Ham Radio" has been legitimized and accepted? Could it be that Greg just plain old does not care about the

global Packet RADIO BBS forwarding network? Try to get a direct answer on that one, some time.

In other words, Spread-Spectrum is a "smoke screen". Greg wants you to "oooh" and aaaah" over Spread-Spectrum, and forget the fact that you just asked about his LandLine Lid activities.

>

Big mountains == good sites for wide area coverage == hidden terminal problems
SPECIALLY in wide coverage sites like Montana.

When north central Montana had a single node in the Sweet Grass hills - it could be reached from over a hundred miles in all directions. And it was. Constantly... Performance was very poor.

The addition of an additional two meter node for local access and a UHF link to the next node south improved things dramatically.

The real answer would have been, as Carl mentioned at the end of the paragraph, a "full duplex repeater".

It may just be that the ease of installing a single frequency node which could simultaneously link to users and other nodes is one of the worst things to befall amateur packet radio...

The only thing I know of that would refer to what you're asking for is
MiniLinux by sp2ong.
It can be downloaded from ftp.li.ncu.edu.pl from the directory
/pub/hamradio or something.
It works out of the box and gets installed on a msdos partition.

Broadcasting the _whole_ bulletins to all end users is not a good idea
(OK, if you are selling disks, then maybe :-), but it would make great
sense to broadcast the bulletin headers to all users. Using the
principles of offline Usenet News readers, the user could select which
unread articles to download and send a request for those bulletins to
be downloaded. It is unlikely that a single person would be interested
in all bulletins that are currently forwarded from BBS to BBS, so if
one person is interested in only 1 .. 5 % of the news feed, it does
not make a lot of sense to distribute the full feed to all users.

If the network is reasonably fast and reliable, there is no need to
store all the bulletin bodies at the local node, you could have a few
larger nodes with more disk capacity to store the full news feed or
even have one big node for electronic homebrewing, one for newsgroups
related to cooking :-) etc. When the user requests a bulletin body via
the local node from the big node, the bulletin body would also be
stored in a cache or proxy server in the local node and could be
retrieved quickly, if some other users requests the same bulletin
body.

However, broadcasting the bulletin (or just the bulletin headers)
requires that the user system is constantly (24*7) on-line and that it
uses a multitasking operating system that does not crash every day.

With multitasking operating systems and having a constant network
access from/to the packet radio net is a security risk, if the
computer is used for anything serious (such as balancing your
finances). While many multitasking operating systems _can_ be made

quite secure, this may require a lot of expertise that the end user might not have.

IMO, the truly distributed computing over packet radio concept is viable when most end users can dedicate a computer (minimum 386) for the packet radio applications.

>text, images, and sound bites makes the amateur network much more
>rich and useful.

I think that the http concept is a good idea for packet radio, provided that the network latency times can be reduced drastically. For mainly text based applications a 9600 bps full duplex backbone is quite enough for quite a lot of users. For more than a decade ago, we had leased 9600 or 19200 lines between offices in different cities and statistical multiplexors at both ends connecting 4 to 8 terminal to each. For data entry and display applications this was quite enough and even when interactive character mode screen editing was used, it was still quite acceptable. Http is not as critical about latency as screen editing on character mode terminals, so it should not be too hard to support a number of simultaneous users at relatively low backbone speeds.

IMHO, for interactive applications, low latency time is more important than raw bit rate. If the latency time is low, it makes sense to update the screen incrementally and not try to load the full screen contents before it is displayed to the user and the user have to wait in order to make the next selection based on what is displayed on the screen.

"Little boy Greg" sure knows how to blow his own horn, doesn't he?

I suppose Greg thinks that with enough misdirection, most hams will forget the fact that he's a LandLine Lid, who sees absolutely nothing wrong with damaging the amateur radio digital network.

He has no (actual, tangible) replacement for it, but our "Little boy Greg", bless his heart, wants to see it all torn down and replaced with Telephone links.

If it's a way to move digital info over a long-haul via amateur radio, (Packet, Pactor, CLOVER, long-haul VHF/UHF nets, AMSAT, ect, then a LandLine Lid system (Amateur TCP/IP) will be there to route that traffic over the telephone instead.

Greg's LandLine Lid buddies (Like he protects at TAPR's BBSSIG) are responsible for destroying most of the amateur radio digital links used by the global BBS forwarding network.. They replace these links with the telephone.
The phone is faster, of course, so the LandLine Lid stations move all of the traffic before the amateur radio links get a chance to. HF forwarders, ect, keep seeing " No thanks, we already have that message". Soon, they have nothing to do, and shut down their systems. -
-- Some LandLine Lids are actually stupid enough to imagine that their "Amateur Telephone" systems are BETTER than ham radio, because the phone is faster. Greg appears to fit into this category.

The way he meanders around and talks in circles, it's hard to tell, but it seems to me that admires the vandalism these "Internet Forwarders" do. He certainly does protect and promote Internet Forwarders.

For my part, I keep wondering what happened to those dedicated hams who pioneered our digital net and selflessly have worked for years to provide our HF forwarding and long-haul VHF-UHF nets. After they have been superceded by a LandLine Lid system and are no longer wanted or needed, these great hams are rudely pushed aside by JERKS with telephones and told they are not needed anymore.

I suppose every time that happens, our "Little boy Greg" gets a big thrill.
-- Kinda like when little boys get that "feeling of power" from breaking a window or some other act of petty vandalism.

Greg seems to think I have a personal problem with him. Actually, except for the faggy "preppie" accent, Greg is really not all that bad to sit around and visit with. He's reasonably personable. It's only when I think of his anti-ham radio rhetoric, and his cheap attempts to weasel out of responsoibility for his own words and actions that I see him as trailing

slime behind. Well, I really should admit that his immature way of handling differing opinions is a bit slimey too.
Other than that, I think Greg is a good Boy.

Many of us are attempting to do exactly that. We use HF/VHF/UHF and any
other
ham band available to move the traffic. We do not use the telephone.
We
welcome others who wish to join us.

We have both done that many times, as have many others (n6iya and n7dxt
come to mind with recent bulletins.)

To recap the main points:

1. We object to hams who use the telephone
to bypass existing radio links.

2. We object to hams who advocate using the telephone
to bypass existing radio links.

3. We object to hams who advocate using the telephone
in preference to building new radio links.

It's that simple.

To recap my difference with TAPR:

I asked that TAPR make a policy statement indicating whether or not
they support the 3 points listed above, since their recent public
statements have indicated they appear not to support them (see recent
postings here and in the TAPR sigs.)

It's that simple.

You will probably not see any response in this forum from n6iya,
n7dxt, or the many others who have commented on this issue on the
packet radio network. Many of these folks do not read this newsgroup.

Charles may provide his own interpretation, I do not speak for him.

Those interested in more information can find it on the ham radio
network, where extensive discussion is still taking place.

3053. Ask TAPR

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-05 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.com>
Message-ID: <01bc71dc$1c31c9a0$4c7141ce@n5pvl>
Source record: 29653

A few quotes from:
Steve Stroh N8GNJ
TAPR Secretary, TAPR NetSIG Chairperson

>We have a router connected to the
>Internet for wide area transport. It's my hope, currently not very
>realized, is to connect via the Internet with other areas of the US and
>worldwide that have substantial local Amateur Radio TCP/IP operations.

Why Oh Why do those mean persons keep calling it "Amateur Telephone" ??
(sniffle)

>What we (those of us that built and maintain the P.S.A.R. TCP/IP Network)
>chose very deliberately NOT to do was to do anything with Net/ROM'ish
>networking, digipeating, Packet Radio Bulletin Board Systems. We chose to
>use TCP/IP, a very robust networking and message transport protocol that
>has a future and is interoperable with the Internet.

And no future at all, without Internet. That's because TCP/IP is worthless
for wide-scale amateur radio digital networking. Without the telephone, the
parasitic "amateur TCP/IP" will do as any other parasite does when deprived
of it's host. It will wither and die.
Hence the urgent desire by people who care more about TCP/IP than they do
about amateur radio to legitimize "radioless Ham Radio", and "Internet
Forwarding".

Pathetic, isn't it?

What a paltry vision that includes nothing better for packet radio than to
be a parasite hanging off of the Internet instead of the proud, independent
ham radio digital network we have today. These people are really a bit TOO
radical.

That's TAPR though, under it's present "leadership".... Check it out.

> > If Packet Radio is irrelevant, what the hell do
> > we need TAPR for, anyway? I thought the letters PR stood for *Packet
> > Radio*, not Internet Service *PR*ovider.

>My original comment said that Packet Radio Bulletin Board systems were
>considered irrelevant by most of the "doers" at TAPR- that's why you
>seldom see a TAPR viewpoint posted on Packet Radio Bulletin Boards.

Why Oh Why do those unreasonable persons keep saying that TAPR is anti-BBS?

>> If you or someone else had bothered to post some of this on packet,
>> perhaps you'd have gotten your message out to those who are ON THE
>> PACKET NETWORK. If TAPR doesn't really care any more about packet and

>> wishes to kill it off, fine, but they really should change their name.

><sigh...> If you can point me to a newsgroup or Internet-compatible
>e-mail address to do so, I will consider doing so.

Let's see... Steve has an extensive "packet radio" network, but can't post a message on packet unless he can find the appropriate Internet newsgroup....

Pathetic, huh? This guy must really be "Mr. Packet Radio", like Greg Jones, who also is NEVER seen on the packet radio network.

Amateur Packet Radio is just not "good enough" for Greg and Steve, I suppose. Phil Karn, either.

>> Yep. We're evolving to the telephone, and Ham Radio is going the way
>> of the dodo bird. Our bands will soon follow.

>Use of the Internet does not equate to using the telephone.

Gee, what a clever statement for the TAPR NETSIG chairperson to make!

>In the case of the Puget Sound Amateur Radio TCP/IP Network,
>bring we bring TCP/IP on RF right to the Ethernet of a Seattle-area
>Internet Service Provider. No telephone lines involved.

"No telephone links involved" in Steve's hookup to the telephone. (ISP)

What a proud moment for amateur radio.. (yawn)

>The ISP uses multiple Intenet backbones, with redundant connections.
Their data center is fully >earthquake hardened and capable of running for days on generator power. Again... no telephone lines >involved.

Another "Internet doesn't use telephones" claim from TAPR's networking expert. Boy O Boy!

It's worse than I thought!

In <33da26e9.30074794@news.cyberhighway.net> glenq@NOSPAMcyberhighway.net (Glen Quarnstrom) writes (order of paragraphs slightly rearranged):

>Yes. The message is that the internet is very useful to those of us
>who have it. But it's not ham radio, is it? In fact, if one has
>access to the Internet, what incentive is there to use Ham Radio at
>all? The only thing packet has to offer is experimentation and lack
>of all the spam, UCE, porno, and bad language we find on the 'net.

Well, no, the Internet is not ham radio, but the two can make very complementary hobbies. Since I work out of my house doing network protocol design for a company that is big on Internet technology I have a home net and Internet access that would make those that care about such things drool (but many folks will be able to get equivalent access in the next few years for the same price as their current dial-up). Data networking is both my job and my hobby.

Yet for some reason I decided to go take my exam recently and go get my Tech license. One of the primary reasons (but not the only) for doing so was to experiment with radio-based IP access. Radio takes me to places wires don't go, and the "broadcast" model is better suited to some applications than landline. I will tend to agree that I will probably stay at home for much of my "Internet-ing" and will use landline for that. But there are time when I am engaging in my other hobbies (e.g., fishing/camping) that ham radio-based IP will be the way to go. I will use radio when it is the right choice. When is it clearly the right choice?:

When one is mobile.
When one wants to broadcast a packet to dispersed nodes simultaneously.
(Others?)

I see most of the above being applied in LAN/MAN applications. Radio for IP WAN and non-mobile point-to-point is less clear, but will agree that there are times when it is a good idea (emergency backup, IP access to remote areas, brain-dead landline providers, etc).

I will tend to agree that if all you want is fast browsing from home, then why bother with radio, but that is just that because it doesn't interest me.

Another important note. One may decide that IP-based protocols are the way to go even in applications where Internet access is of no importance. The main goal of IP is to define a common network layer for may different link types. Even in the radio world there is enough heterogeneity (bit rate, loss rate, loss distribution, etc) that IP-based archtitectural approaches are a good way to go. They have often supplanted other approaches in the

landline-based enviromnment, and they may do so also in the radio-based environment. To quote one of the orginal designers of the TCP/IP protocol suite (either Postel or Cerf, I think): IP on everything. (Say it out loud).

The old BBS model has disappeared in the landline world for reasons only rarely related to content (there was/is plenty of porno on the old landline BBSs). In fact, many excellent BBS's (Circuit Cellar comes to mind) have moved off the old model to the Internet, still offering the same content.

BTW, I take severe exception to your assertion that there is no experimentation on the Internet. Most of the neat new stuff you see today as an end-user of the Internet was due to someone playing around on the home or lab PC/workstation. The experimental community in the Internet is HUGE. I would tend to argue that the percentage of forward-looking experimentors is larger in the Internet community than the "Radio" community. To get these percentages I pool cellphone / CB users / many Hams in the class of "Radio" folks the same way that I include folks who just use Usenet/Chat/WWW in the Internet class. Forward-looking packet radio folks could be considered equivalent to the MBONE experimental community I work in.

>But it's not getting out to the rank and file that you'll need if you
>want any chance of new ideas getting the mass support needed. In the
>meantime, those who present the anti-TAPR agenda go unanswered, thus
>damaging the TAPR image further.

Maybe you can help me understand this pro-TAPR vs anti-TAPR agenda. If you don't like their focus (and are unable to change that focus), go and start a similar orgnaization with a more appropriate focus. If certain "leaders and shakers" want to join one or the other organization (or not) because of a personal focus, then so be it. The "rank and file" will become active in the appropriate group for the same reason. A particular individual will switch roles at various time depending on their inclination, background and expertise. TAPR is a great resource but do they really have a monopoly on the TRVTH? I can see many other ways to get out the word other than TAPR-sponsored lists.

Things are a lot different at the local level, of course. (Does TAPR have local activities in some area? I am only aware of the more outward-looking non-local activities.) I will need to become part of the local ham community to do the sort of things I want to accomplish. That means that I will have to find a way to reconcile the needs of those who want to keep their existing gear and services with the new gear/services I would like to experiment with. ANY sort of pro/anti attitude in such a context is a REALLY bad idea. Even if I have personal problems with someone, I have to "live" with them, and need to respect their position in the heat of discussion. (Even then, sometimes "divorce" is the best thing for all involved if there are irreconcilable differences)

BTW, unless you are really, really good at it, email is a really, really bad way to resolve such disagreements. I personally worry that, unless folks really start to understand the different dynamics of using this media (by

spending some serious thought-time on it) we are never really going to be able to build smoothly running distributed communities.

(BTW, there are lots of "I"s in the above, since I only think I can speak for myself on these issues)

Hmmm... Hank, this might be breaking news to you, but "The Internet" IS present in the Seattle area, at any number of Internet Service Providers, corporations, universities, etc. Those are dedicated, high capacity data connections- that can't be confused in any way with "the telephone". Put another way, if a communications like doesn't CARRY telephone traffic, it ISN'T a telephone line.

In the case of the Puget Sound Amateur Radio TCP/IP Group, we bring the RF TO the Internet. The actual junction point is a major Seattle-area Internet service provider.

> What is the name of this ISP? Perhaps we can establish an RF link to
> it from down here in the Portland area. That would be whizzy!

The name of the network is the Puget Sound Amateur Radio TCP/IP network, also called WETNET. It's home page is at http://www.wetnet.ampr.org.

> Steve, let us all know how this stuff in Seattle works.

Quite well. I wrote an paper on it for the 14th (1995) Digital Communications Conference (http://www.tapr.org/tapr/html/cnc14.html for an abstract), and a slightly updated version was included in the ARRL's recently released book "Packet: Speed, More Speed and Applications -- 2nd Edition" (http://www.arrl.org/catalog, select Digital Communication). As for the inevitable question, no, I received no compensation from either publication other than a complimentary copy of the books.

> Sounds very exciting that you have found a way to access the internet
> without using commercial wire networks (i.e. "the telephone").

I didn't say without wired networks. I said without use of telephone connections. That you equate wired networks with telephone connections is badly mistaken and only confuses the issue. If you stick with the more factual term of "wired networks", then this discussion would be moot.

> Please post contact information for
> the ISP you use so that others who are interested in ham radio

I am running Ritty 2.0 es Win95 , I have win95 base system, only dos version available is the
DOS that comes with Win95. I am trying to fine tune my system for the best performance with
Ritty. Also if anyone know how I can add DOS 6.2 to this crazy setup would sure appreciate
any help. Also would like hints from people who have successfully run Rtty by WF1B with
Ritty 2.0 in the Win95 format.
Every time I try to run Ritty with Wf1B it works find until I shut down es then try to use it agn a few minutes later. have to totally re initialize everything es doing this loose all the stuff that was recorded in WF1B.

Tnx in advance Ian Ve7ira

> kill it off) before a viable alternative is in place.

The people that formerly supported PBBS and Net/ROM networking are allocating their time, energy, and money to other things- some Amateur Radio, some not. More accurately, the "net" you speak of is dying of neglect.

> Huh? Why would you need an e-mail address to post bulletins on the
> existing packet network? Are you that far out of touch with reality?

YOUR reality, that Packet Radio Message Forwarding Bulletin Board Systems continue to be a relevant communictions technology in 1997?!?! Yes, I'll happily, GLEEFULLY admit that I personally have advanced beyond that mode of communication and don't care to devote my time, energy, or funds towards their advancement or even their continued existence. That others do... cool!

> Even if parts of the Internet use RF, it still is NOT Ham
> Radio. The simple fact of the matter is that if we want to use the
> Internet, there's no reason whatsoever to even use ham radio. The
> Internet is likely to always be faster, cheaper, and more efficient
> that ham radio.

Uh, no. A friend of mine, recently relocated to the Seattle area, was part of a team that constructed a 56K in-band UHF repeater to provide Internet access to rural locations in his area. It works great, and puts our Amateur TCP/IP network in the Seattle area to shame (which he has plans to correct!) I'll be working with him to document that system for the 16th Digital Comminications Conference this Fall.

Glen, what is it that grinds at you so much about those who are choosing to make effective use of a combination of Internet and RF links? Is it that they work well? Is that some of us have fun doing so? That we aren't devoting that time, energy, and money to an effort that you personally feel is worthy?

> I've been on packet since
> 1988, and I never saw any of this until I came here to the Internet

> information.

No surprise there. You came to where the relevant information is
available- the Internet.

> The "other side" has been quite vocal on ham packet.

No doubt.

> Where are the rebuttals or explanations from your side?

When you came onto r.r.a.d.m., it seems to me that you received ample
rebuttals and explanations. Since you're so concerned about this
information findings its way onto the "PBBS Network", are YOU forwarding
it there?

> When I was
> first on packet, there were a lot of informative bulletins about what

> have moved on to more esoteric things, leaving the functional system
> to fend for itself, and offering no support for the existing system or
> ideas on how to move to the next level. It's the exact pattern I've
> discussed here earlier.

Apparently you're failing to grasp the fundamental relevance of this fact
"that the techie types have moved on". No blame can be assigned to "the
techie types" (and I happily count myself in this category, both techie
and having moved on)- they're doing what's interesting and relevant TO
THEM. That's the primary motivating factor for Amateurs to accomplish
something in Amateur Radio- interesting, relevant. If those factors are
absent, the result is predictable.

As far as ideas on how to move onto the next level, here are two.
Purchase the last 5 or so issues of the Digital Communications Conference
proceedings and read through them. There are numerous ideas on "next
generation" Amateur Radio networking. Set aside an evening to browse
TAPR's Web site at http://www.tapr.org and to follow the numerous links.

> I stand by what I said earlier. Packet Radio is dying, and will soon
> be dead, for all practical purposes. Read my earlier posts for the
> reasoning.

Packet Radio, as in Packet Radio Message Forwarding Bulletin Board Systems
and Net/ROM type networking? Think of its impending death as evolution in
action.

I think I've done as much good as I can with this thread. I'll contribute
to its conclusion by not posting any further followups, despite the
inevitable responses by Glen, Hank, ad nauseum.

No.

There shouldn't *be* any hidden terminals. The only people who should be
allowed to access the mountain top nodes are the backbone providers.

Use the mountain top node to carry backbone traffic in bulk over the
mountain, then allow end-users to access the traffic via "sea-level"
nodes at each end of the trans-mountain link.

So I take it then that you are not opposed to using the Internet in areas where there are no existing usable links? Here in S.W. Idaho we have basically lost all our links to the outside world. There are still two marginal links left, but both are controlled by Lockout Lids, so forwarding is impossible or impractical. In any case, it's so far to the nearest BBS that forwarding would be difficult in any case.

We are currently getting our BBS packets from Marty Albert's excellent service, but he doesn't have many PNW bulletins at his site. It'd be nice if somebody would forward a more comprehensive collection of PNW traffic to him.

Evidently. Still, there seems to be more to it than just that policy, from what I've been able to gather so far. Perhaps there'll be more constructive discussion of this here soon.

>Those interested in more information can find it on the ham radio
>network, where extensive discussion is still taking place.

ASSUMING that those interested have access to all those discussions, you mean. Obviously, we don't all have such access. Even with the

situation I described above, I suspect we only get about half the
relevant bulletins here. Seems to me this subject is worthy of
widespread and continuing discussion. It's sure a hell of a lot more
relevant and important than beating the old, dead code/no code horse.

But most, if not all, of these will be or already are available
commercially, and will probably always be cheaper and more efficient
then packet radio.

>The old BBS model has disappeared in the landline world for reasons only
>rarely related to content (there was/is plenty of porno on the old landline

>moved off the old model to the Internet, still offering the same content.

That's mostly a matter of cost and perception. I still call long
distance to a BBS in L.A., where I find a much better S/N ratio than
anything possible on UseNet. I've also found it much easier to make
new e-friends on BBSs than on the 'net. BBSing still has a place,
IMO, but, like ham radio, suffers from lack of publicity. BBSs have a
lot on common with ham radio, actually, and suffer from the same
problems. A commercial system will almost always beat out a volunteer
system if both offer exactly the same service. Putting ham packet on
the Internet seems to me to be a risky thing, unless packet can offer

something different from and/or superior to the 'net. Otherwise, the
'net will swallow up packet just as it has swallowed up BBSs, which is
a real loss of a great community resource, IMO.

It's probably possible to write software to put the guts of a BBS on a
web page so that it wouldn't require an expensive 24/7 connection, but
it's probably too late in the cycle to achieve that. Something
similar may be possible for ham BBSs, but I haven't given that much
thought.

>BTW, I take severe exception to your assertion that there is no
>experimentation on the Internet. Most of the neat new stuff you see today as

I don't recall saying that, and never meant to imply it. The
experimentation is different, in any case. One cannot generally use
the commercial RF bands for anything but a narrow and strictly defined
purpose, so experimentation is limited primarily to the ham bands.

>Maybe you can help me understand this pro-TAPR vs anti-TAPR agenda. If you

I can't really do that, because I'm not part of it. I'm only a
catalyst here, trying, like you, to make sense of what I've been
seeing.

>Things are a lot different at the local level, of course. (Does TAPR have
>local activities in some area? I am only aware of the more outward-looking

Not that I'm aware of.

>BTW, unless you are really, really good at it, email is a really, really bad
>way to resolve such disagreements. I personally worry that, unless folks
>really start to understand the different dynamics of using this media (by
>spending some serious thought-time on it) we are never really going to be
>able to build smoothly running distributed communities.

That's always been the problem, and I see no way around it. It's
inherent in the dynamics of ANY purely volunteer situation, since the
only "reward" is limited to non-monetary considerations. To all too
many people, one of these "rewards" is to throw one's weight around.
I know from experience that it's extremely difficult to allow those
you don't like to have full access to a system that *you've* built and
financed. Thus you have the lockouts and redundant systems, etc,
which severely hamper the development of any functional system. I'd
suggest that any new protocols should make it impossible, or nearly
so, to bar any legitimate ham from using the system.

>(BTW, there are lots of "I"s in the above, since I only think I
>can speak for myself on these issues)

True for most of us.

>kevin, WB2EMS

I have a 250Hz and 500Hz in my 765. Most of the time I use the 500 for
TOR/RTTY and the 250 for RTTY during contests and on 40/80 meters. The 250 is
almost too narrow so I tune using the 500 then switch down to 250 if needed. I
think 350 is a good compromise. I have my DSP-59+ set to 350 when using the
500 IF filter and have no problems with RTTY but I open it up to 450 for TOR
modes.

>therefore I don't use these modes...

Actually, the Clover II waveform is well documented. It is a Dolph-Chebyshev
pulse with characteristics fully documented in the Clover manuals.

The protocol is also documented in one of the ARRL Computer Networking Conference
Proceedings (and in a couple of magazine articles). HAL also has a 200 page technical
reference available. Of course the protocol *is* proprietary, and would require licensing
if
someone wanted to produce clones. HAL has expressed a willingness to license the protocol
to other amateur manufacturers, however.

It should be noted that Kantronics' GTOR is also a proprietary protocol. I don't have a
problem with that. It is really no different than proprietary software, IE things like
KAGold,
or Beezley's RiTTY. If you want to use it, you should have to pay for the use of the
intellectual
property rights involved. I also don't have a problem with HAL or SCS using amateur radio
as a proving ground for techniques with commercial application. After all, that is one of
the
purposes of amateur radio, to aid the advancement of the art by acting as a large free form
beta test organization. In return for that, amateurs get to play with cutting edge
technologies.

Packet BBSs are hardly new technology. Nor isTAPR trying to kill BBSs.
TAPR has always been focused on the development of packet techniques
and technology. 15 years ago that was a BBS network, but that's past being
a mature technology now, and TAPR has moved on. If you still want to play
with BBSs, you can, but you shouldn't expect packet radio to stand still to
accomodate you.

By hardened, I mean that the site can withstand any single failure and continue to function. That is the *minimum* we can tolerate to make it a viable substitute for the wirelines. We figure that a typical site in our network costs about $2,000 (some cost more, a few less, due to differences in site requirements). To harden it to an acceptable level for emergency preparedness, we'd need to at least double that figure.

Now figure that just to give WAN coverage to North Georgia we needed about $120,000. But the GRAPES annual capital budget is on the order of $12,000, so it has taken us about 10 years just to get where we are. To cover the US, figure about $12 million minimum, and that doesn't count site rental fees (those can be brutal) or other recurring costs. Nor does
it allow for upgrades or maintenance. Double those numbers for a network hardened to tolerate typical emergency preparedness requirements.

>>Even if *every* amateur became active in the digital modes, that wouldn't change much.
>>Our distribution is still extremely sparse in many areas where we *must* have trunk
>>connectivity in order to have a viable WAN.
>
>So the LANs in the areas served need to pony up for the WAN trunks ... sounds
>like an "association" to be formed ... with some membership assessments ...

We *do* that. GRAPES *is* our state networking association. But there's a practical limit to how much we can bleed out of our users. More importantly, there's a limit to how much *time* we can require from our network maintenance people in order to install the network

and keep it functioning. TAPR is right, building and maintaining a viable national WAN is beyond our reach. We need to concentrate our limited resources on the local LAN and MAN levels where we can make a substantial impact, and leave the national WAN task largely to the wireline providers who have the resources to bulid and maintain it.

We can use amateur satellites and HF to a limited extent to implement the WAN, but the throughput we need just isn't there unless we discontinue all other amateur uses of HF. That isn't going to happen. That shouldn't stop us from trying to do *something* in the WAN area, but we should be realistic enough to know any such effort will return only marginal results.

On average, there are about 3,000 amateurs per state using digital communications in the US. But those amateurs are distributed very non-uniformly. Some expanses a WAN needs to traverse have *zero* local amateurs to build and maintain it. This sparseness is the ultimate reason why a modern national WAN is impractical for us to implement. Just in Georgia, some of our maintenance people average well over a hundred miles per weekend just to get to and from sites under construction or needing service. I'd hate to think what would be required of amateurs in less densely populated states. We can't expect most amateurs to demonstrate that level of dedication. They have a life outside amateur radio, and other demands on their time than the amateur network.

We have to make a choice. We can either have a very thin WAN, with extremely limited throughput and spotty coverage, or we can have a number of robust LANs and MANs with good performance, coupled together by the wireline networks. We don't realistically have the resources to do a high performance national WAN.

TAPR appears to have opted to concentrate its efforts on robust LAN and MAN technologies at present. Others may want to work toward a thin WAN. I'd love it if we could accomplish both.
I've put in a lot of time on the GRAPES network, and as you know I'm doing experiments with advanced HF methods which may be suitable for the thin WAN. But I think TAPR has made a good choice in concentrating on improving local networking technology. That's where TAPR can have the most impact at present.

Lovely non sequitur, as usual, Carl. There's nothing incompatible
about full duplex repeaters and "BBS/dumb terminal paradigms." And
furthermore, there's nothing archaic about packet BBSs, which, after
all, are doing pretty much the same thing that UseNet does. Not as
efficiently, of course, but that's a different argument.

>> It may just be that the ease of installing a single frequency node which
>> could simultaneously link to users and other nodes is one of the worst

More undocumented, irrelevant nonsense. Why don't you give it a rest,
Carl? Anybody who's interested (and most of us who aren't interested)
have seen your nonsensical elitist crap so many times we could quote
it in our sleep.

If you're so damn smart and gung-ho on building this magic mythical
Ham Network Of The Future, why don't you just run along and build it,
rather than spewing your invective all over this group?

Better yet, why not get UseNet itself to work like it should? I get
far better reliability from the QWK BBS I call than I do from UseNet,
where as many as half the articles never arrive at my ISP. And don't
tell me to get another ISP. From what I've read and seen, they all
have similar problems. Even Deja News doesn't get all the articles,
and it's often painfully slow on updating the ones it does get.

If this new pie-in-the-sky packet net doesn't work any better and
faster than UseNet and the WWW, it's not going to much of a system, is
it?

I won't even get into the unreliability of the IRC nets, not to
mention all the other crap that goes on there.

Hello kevin.. I have a 400Hz filter in the 8.8MHZ IF of my Kenwood TS-450s,
and it is just about the narrow limit for 200 baud pactor. The filter is sold
by IRCI, and has very steep skirts. According to the formula commonly used
for determining the bandwidth of a RTTY/PacTOR signal, 200 baud PacTOR is
approx. 400Hz, and maybe even a little bit wider. The 350Hz filter sounds too
narrow, and you would probably take a lot of hits at 200 baud.
I do use my 270Hz IF filter for 45 baud RTTY, and the tuning is very tight.

Good luck! -- Glenn AE0Q/V31RY

>I figure that if SS is better, then people will build it. That's great.

It's interesting to note, that there's a trend of the "land line"
commercial
folks towards the wireless. AT&T is talking of entering the local phone
provider business with "wireless" hubs. A major Internet Service
Provider,
in the Puget Sound, Sillycone Valley and Washington DC areas is offering
"wireless" access in the 28K baud speed range.

The radio/modems are license-free and running in the 900 MHz range.

Guess what technology these folks are using? Yup. Spread Spectrum!

The radio/modems are available off the shelf for $600 or $300 if you
promise
to subscribe to the service for a year.

I would not say such technology is experimental or hard to obtain..

It's also interesting to note that the data running through this system
from the
users computers to the Internet is "TCP/IP"...

While I disagree with Charles that gateways are a bad thing, I do believe
we've a great many, of too long neglected, opportunities for the future in
improving
the RF system, both on long haul HF and local access VHF.

Source record: 29591

Reply comment deadline for FCC Docket 97-12 (In the Matter of Amendment of Amateur Service Rules to Provide For Greater Use of Spread Spectrum Communication Technologies) was yesterday June 5th.

TAPR has started posting reply comments on our Spread Spectrum web page: http://www.tapr.org/ss then go to the link "Spread Spectrum Rule Changes (RM-8737 & Doc. 97-12)"

The following reply comments are currently available for reading:

Tucson Amateur Packet Radio Corp 6/5/97
Lyle Johnson, WA7GXD 6/5/97
Glen Elmore, N6GN 6/5/97
Robert Buass, K6KGS 6/5/97
John Ackermann, AG9V 6/5/97
Steve Dimse, K4HG 6/5/97
Tom McDermott, N5EG 6/5/97
John R Bingham, W7WKR 6/5/97
John Koster, W9DDD 6/5/97

We expect to have more posted over the coming month as others send us electronic copies and we get copies of other filings directly from the FCC.

If you filed a reply comment and would like to have it available on the web page, please drop me an e-mail message with the text of the reply comment.

Cheers - Greg Jones, WD5IVD

Listen between 14.060 and 14.080 MHz for Pactor. Listen to 14.100+
for the disaster called HF packet. You'll find plenty of action. There are
similar spots on all the other HF bands.

But working satellite packet is often going to be easier and less costly
than setting up a HF operation. Antennas are much smaller. Power levels
are generally much lower. Propagation is totally predictable. Etc. Stations
which fit in a briefcase are feasible for those on the go. I don't know where
the idea that working digital satellites is difficult or expensive originated,
but it just isn't so.

(Ok, you *can* do HF digital from a briefcase too, but you're going to have
to string a substantial antenna to do it.)

>While I'm on the subject of packet or pactor. Why can't we use the modem
>in our computers to work packet. I would think that most modems would
>have no problems running at 9600 bps, 1200 bps, or what ever speed you
>might need. Can anyone explain why we are not use these modems.

Higher speed phone modems need to execute training sequences with their
counterpart in order to fit their signals through a particular phone connection.
In practical terms the channel has to be full duplex as well, or training would
take forever. And they must have the contact set up out of band, IE dialing,
ringing, and answering the phone is handled separately from data transfer.
And they absolutely demand an exclusive and non-varying channel for the
duration of the contact.

None of that exists over radio for packet. Training is impractical because contact
setup is done *in band*, IE every station must be able to read every other station's
data stream in order to establish its identity (callsigns are embedded). That means
that they must be able to operate without training. Radio channels typically aren't
full duplex (though on VHF+ that can be practical). And the radio channel is not
invarient nor is it by any stretch of the imagination exclusive for the duration of
the contact.

And also the "smarts" in a telephone smart modem are the *wrong* smarts
for packet radio. Few current telephone modems allow you to bypass those

smarts and operate the modem as a dumb modem (thus allowing you to implement AX25 channel management in software on the host).

Thus ordinary telephone modems are totally unsuitable to the packet radio environment. Very old telephone modems, such as the Bell 103 and Bell 202 modems, were dumb, could operate half-duplex, and without training. And in fact that's just what packet uses, Bell 202 on VHF+, and Bell 103 on HF. But modern telephone modems don't usually support those standards any more.

To gain speeds greater than 1200 baud on the radio channel, we need to do things differently than are done on the telephone line. We can do that. One good way is called MSK. There are other ways, mostly of the M-ary sort. The key feature of radio modems is that they must not need training in order to achieve call setup. And they must allow us to use protocols which deal with the noisy, fading, interference plagued radio channel. Current phone modems won't let us do that, so we can't use them.

> of the Texas Packet Radio Society's Quarterly Report:
>

I always hate to be taken out of context, so here is the full article as published in the Q-Report attached below. Now what Charles doesn't think about is 'why I wrote it'. Who was the target audience.

TPRS at the time I was writing this was and is suffering a down turn in membership and network stagnation. The purpose was to get people thinking about the future and hopefully get them active in at least doing something. I might not be right, but at least in Charles' case my goal was fully realized. Just look at the energy he has expended over the issue. I just wish it was a little bit more constructive in nature though -- like being a part of the solution -- building, maintaining, or helping the current TAPR TexNet cause. There are to few people in the TPRS regional group that do a lot of work and another pair of active hands could be the difference in keeping links up and working between Texas and Oklahoma.

I hope the article posted below gets others to think about where we have been and the possible future. Future theory says that you can not predict the future. All you can do is prepare your mind with different concepts of reality, so that as things change you can adapt to the situation.

Also, all of my writing as President of TAPR can be found at: http://www.tapr.org/tapr/html/presidents_corner.html or on the top level of http://www.tapr.org If you want to see what I have been writing in TAPR then check out this page.

Also, please note I use the term 'wireline' not 'telephone'. Big difference. Several segments of the existing TexNet network, which Charles uses to forward many of his packet radio BBS messages to others sysops transits across some of these commerical wireline pairs that TPRS (TexNet) has been able to use over the years to tie areas of Texas together that we would never be able to build nodes into. TPRS has even designed it owns 4-pair wireline modems to help trouble shoot remote sites that we can't get access to in order to set levels on connections -- ture in the spirit of experimentation and development. When building networks, the concept is communications and sometimes in order to provide the service to fellow hobbiest you have to take advantage of what presents itself to make it happen. Just ask Harry Ridenour, N0CCW,

TexNet network manager for the last ten years.

Also, I think you will find me discussing mostly the issue of building new RF networking systems. Not talking about how to corupt packet radio into something it isn't about. I'll let my words speak for themself -- in there 'context'.

I hope you take a second and read my thoughts below. Keep in mind that they are a year old, but I still feel that amateur packet radio digital communication users have to make a decision 'are they willing to invest in the future of the mode ?'

Cheers - Greg, WD5IVD

Amateur Radio Networks: Are Amateurs Willing to Pay the Price ?
Greg Jones, WD5IVD
(wd5ivd@tapr.org, http://www.tapr.org/~wd5ivd)

What is a 'good' amateur radio network ? Is it our current 1200 baud or 9600 baud systems ? Are amateurs willing to pay the price in money, time, and manpower to make our current networks into 'better' networks ?

In 1982, it was the ability to use a local digipeater to be able to connect to the local BBS and even to chat with someone locally at 1200 baud. In 1985, it was the ability to use 9600 baud networks to be able to connect to the same type of BBS or a friend located any where across the state. In 1990, it was the ability to have access to new types of services (i.e. NWS, Radar, DX Cluster, etc). However, during the entire 10+ years, the user access speeds never increased -- even when plug-n-play equipment was available.

Why ? The equipment and technology have been here. Are 'hams' just too cheap to do it ? Why should any amateur radio operator be surprised that numerous 'hams' are leaving amateur radio for the Internet. It does many of the things that they find fun in amateur radio and access is a lot better. There are no local disputes, no club politics; it works all the time. There is no one telling them they can't get access to Houston, because there is no RF path, etc. It just works. But how can hams spend $240+ a year for Internet dial-up modem access and not spend the same amount for amateur networks that could easily have better access than they get from their dial-up Internet providers ?

Amateurs in Texas, Oklahoma, and Arkansas, as well as the rest of the US, will shortly be faced with a decision. Either spend the money, time, and energy to upgrade existing amateur networking or watch it crumble. The most valuable things in any of our networks is not the equipment or networking technology, but the site locations and the few people who maintain them. In the TexNet network, we have very valuable sites that

could easily be used to build a new TexNet network on-top of the existing one. As for the networkers who work the sites, we have to design a system that does not require one of them driving 5 hours to fix a node. Eventually, we will burn them out with the current network we support. The technology is here now -- and we better do something with it, or we can forget the 10+ years of work and effort that has been put into the existing networks.

In years past, we had many discussions and meetings on where TexNet should be going. The problem always came down to 1) cost of higher-speed radios and 2) how to make a new network backwards compatible with the older system. The radio problem, with the help of TAPR and others, is about to fix itself. The second item really comes down now to jumping to a new network all together. We leave the existing TexNet network in place and build a new one on top of it using new technology. In this manner, the older users are still supported, but a newer, faster network can be put in place.

What do I mean by 'newer and faster' ? TexNet-2 should support the goal of providing high-speed local loop access, with enough RF and wire networking to tie nodes and regions together to support these higher user speeds. No user should be more than 2 or 3 hops from a high-speed link to the next regional area or a system information server. We have to eliminate the need to transit the entire state to get one bit of information. Speed is everything, unfortunately, for the survival of our existing networks. Amateurs are leaving our current systems because they perceive Internet as a better service, even if we consider that our phone modems operate at around 1200 baud. If we do not go at least as fast as 38.4Kbps on the user access ports, why do anything ? We might as well leave amateur radio and go to the Internet or Part 15 devices for communications. The answer is easy -- nothing is stopping us from implementing high-speed RF within Part 97, that can't be found at twice the price in the commercial communications area.

Some might say that I have just made a pact with the 'Dark Side of the Force' by saying we should use wirelines and the Internet to connect regions in Texas, Arkansas, and Oklahoma and the U.S. at high-speed. My answer is no, we don't turn off the existing TexNet backbone, but use it for what it is good for, that of providing long-haul RF paths when our primary high-speed routes die. Many might say that the commercial wirelines are unreliable; however, the commercial world is learning every time there is a disaster that takes their equipment off-line. Soon, many commercial systems will not be affected by earthquakes and other such natural disasters. But when they are, we will need RF systems like the TexNet backbone which exists today to provide information flow. However, if we lose membership within TPRS because the existing network does not support what members want to do -- then the RF network goes away completely. Better to do new approaches and methods now and be able to keep things operational both with new and old systems, than to have no systems at all in place. Basically, the types of information flow amateurs want to do today, can't be supported with the existing TexNet

network. This does not mean that the usefulness of TexNet has gone away. If anything, by invigorating the digital community again with new networking, we can continue to support the slower speed TexNet for emergencies when e-mail and bulletins are the only things that need to be passed some distance away.

Nothing is stopping us from putting up a backbone that operates at 2 Mbps or user access systems that operate at 64,000bps (twice as fast a any 28.8Kbps dial up modem). Using Spread Spectrum technology that is currently employed under Part 15, which can be used under part 97 (soon), and new technology that TAPR and others are working on, the tools to be able to implement a new network that provides 'faster' access to amateurs is here.

The only thing stopping us is ourselves. Do amateurs in Texas, Oklahoma, and Arkansas want a network that they can access from home at 64K+ speeds in order to access the Internet, do digital video, or whatever you can think of doing at that speed ? If you do -- it is time to spend the money and time to make it happen. However, if you want ISDN speed access from home over amateur radio, it is going to cost more than 1200 baud 2-meter packet TNCs. Maybe a cost of more than $500+ per home unit. Will you spend that ? Many have been spending that much to do 9600 plug-n-play. Many have been spending around a $1000 to do DSY 56K technology. A $500 price point is cheap, considering that an ISDN to Ethernet box (Ascend Pipeline 25) costs $1000 for ISDN access at home, it costs you several hundred dollars to have installed and probably about $80 a month for the central office connection and Internet access fees. $500 - $1000 for a user access radio is half the cost of installing ISDN at your home for the first year. I would think hams would find that a huge savings !

In addition, will you support your local network node for the $1000 - $2000 it will cost to put up a node that can service your new radio ? Without the infrastructure to support your radio, you can't get access at the speeds you want.

Now, I keep saying 'we' above. This is a 'we' not 'me'. While several of the typical amateur operators you find running about doing things can help install new nodes and work system problems, without 'you' putting forth the energy and effort to at least state that you want to see change, then nothing will happen. 'You' have to take an interest, contact the local movers-and-shakers and say you want to see better networking. You then have to have someone in your area become the led on the technology. Find out information about what is happening and see how to get involved in what will happen next. Finally, you have to be willing to write a check to your local club or group to purchase the necessary equipment for the network node and then purchase equipment yourself.

Are you willing to pay the price for 'better' amateur networks that can perform much better than what you are probably paying for monthly ?

If so, it is time to start making a difference.

Mailloop v3.0 is an industrial strength bulk mailer.

Mailloop v3.0 is a bulk mailing program for the internet. It can take a single message and broadcast it to either a listing of e-mail addresses or to a listing of newsgroups. Creates custom newsgroup lists by filtering NNTP servers. Creates custom e-mail lists by extracting them from newsgroups. Can also extract e-mail addresses or newsgroup names from other protocols. Built-in NNTP, SMTP, POP, FTP, HTTP, EXEC, CGI, WHOIS and FINGER clients. Anti-cancelbot feature. Automatically processes remove requests. Includes extensive on-line help.
The most powerful bulk mailer available. Requires Windows 95 or NT 3.51+ and internet access.

The "Program" Mailloop is only available in English.

For more info goto: http://205.199.4.219

http://205.199.4.219

Using it is easy:

1) Create a message (http://205.199.4.219/editor.htm)
...by using the pull down menus or
...by using any editor

2) Create a newsgroups list (http://205.199.4.219/news3.htm)
...by filtering an NNTP server or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from any FTP file or
...by extracting from any HTTP file

3) Create an e-mail list (http://205.199.4.219/em3.htm)
...by extracting from newsgroups or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from a WHOIS response or
...by extracting from a fingering response or
...by extracting from a UNIX response or
...by extracting from any FTP file or
...by extracting from any HTTP file or

4) Broadcast the message
...to the e-mail list or (http://205.199.4.219/embc.htm)
...to the newsgroup list (http://205.199.4.219/ngbc.htm)

5) Then process the remove requests
...by using the mailbox processor (http://205.199.4.219/pop.htm)

Charles,

Having known Greg for a number of years, I can say categorically that his motives, honesty and character are beyond reproach. Your attempts to smear his name are uncalled for, and your characterizations of him are just utterly wrong.

Never having participated in BBSSIG, I've no first-hand knowledge of why you were locked out of it. But if the messages you posted there were similar in character to the ones you've posted here, I'm surprised it took them so long to do it.

Disagreement is one thing, personal abuse is another. Whatever the merits of the case you're trying to argue, ad hominem attacks won't help it.

"Lockout Lids" - a good choice of phrase Glen. I wonder if we will
see a damning indictment from Charles about these "Lockout Lids" and
the damage that they are doing to packet radio networking in your area ?

Then again, in the absence of mitigating circumstances, "it's my station,
and I'll decide who/what goes through it" can be a very awkward position
to argue against.

Sorry to hear about your plight.

Gareth.

It doesn't explicitly appear, but then again, in terms of the "long-haul
amateur radio links" that Charles refers to, "HF" is not excluded either!

Cheers,

Gareth.

<remainder deleted>

Dear Greg,

I'm a bit curious exactly what it was I did that caused me to be
removed
from the TAPR SIGs. Whatever action it might have been was never
explained
to me. I discovered that I was removed when my postings stopped
showing up
in the group. I was still subscribed to the group, and it took two
weeks
to manage to convince someone to unsubscibe me, since I was not
allowed
to unsubscribe. I now hear that there is something about my
"attitude"
that bothered the folks in charge of the TAPR SIGs. There has never
been
any explanation what it was I said that was bothersome, nor of what
"attitude" is required to participate in the SIGs.

My postings were indeed on topic, and were directed to a thread opened by
myself and responded to by many other SIG members. In my opinion I never
made any personal attacks on anyone, did not attempt to perpetuate any
"holy war" (whatever that might be), and directly advanced the topic
at hand. The problem appeared to be the topic itself. See my prior posting
in this group for an explanation of that topic.

Would I rejoin the BBS SIG? Certainly not. It appears to have an agenda
that runs counter to what one would expect of such a group. Were the SIG
to come back on topic, with a charter which clearly spelled out what that
topic was, then I might consider continued contribution.

However, unless TAPR makes it clear that the BBS SIG and NET SIG are for
the discussion of Amateur Radio BBS issues and Amateur Radio Networking,
and can manage to keep the discussions at least somewhat on topic, the groups
are of no interest to me, and I will remain unsubscribed.

The above paragraph describes, in a nutshell, the issue and discussion
that bothered TAPR so much they decided to remove me from the SIGs.

Will TAPR respond in a direct way to this issue? I doubt it.

Oh. I thought you were talking about ham radio networks.

Who's wires are they?
Common carrier? Private carrier?
You strung them yourself?
They are not wires but perhaps common carrier microwave?

Why quibble terminology?

Any place I use the term "the telephone" replace it with "commercial
carrier facilities" if that will help you to understand what I'm saying.

If you don't like "commercial carrier facilities" you can use the term
"non amateur radio facilities" if you like.

And I object to ham's who insist on displaying their butt-cracks at hamfests. So what. This whole crusade sounds like nothing more than a few desperate men looking for a villain to blame for the demise of the BBS and netrom systems. I realize you spend countless hours setting up and debugging your bbs system, but you've had your moment of fame.

There are no 'phone-links' boogie men destroying ham radio. The users of the bbs empire just got bored. In 1980 it seemed kool to sit for three hours in front of the terminal and wait for the bbs to dump 400 irrelevant message headers, now 17 years later it's not nearly as much fun. New toys are becoming more common but the new toys don't blend very well with the old 300/1200 baud packet standard. As a result the face of ham radio packet is changing.

If your point in clinging to the 'past' is to preserve it, no problem, but if your point is to prevent change from occurring, *THAT* is a different issue.

I could not care less how the packets sent out via my radio get to their destination. As long as *I* use ham radio in MY part of the system i reserve the right to CALL it 'amateur radio packet'. Going one step more: If so much as one hop of a link is via some ham's RF, then here in the US we are required my the FCC to restrict the traffic under the rules of amature radio. In my book that restricts that entire network to the status of 'amateur radio packet'.

If you would like to keep your little piece of the universe 'radio-only' that's find with me. If not, that's fine too. The only thing that pisses me off is when one faction or the other starts talking about regulation!

Greg,

Please explain why using "wireline" is different than using
"telephone"
to bypass radio networks? It is the pedantic quibbling over details
like this that bring agendas into question. I've tried to keep my
comments
strictly to the "3 issues" that I posted previously. The key words in
those issues are "bypassing" and "instead of".

If TAPR is indeed in favor of using radio instead of telephone*, what
is
the problem with moving the SIGs over to that discussion and removing
discussion which is off topic?

* Note: "telephone" in this context means "non ham network
transport."
I'm really tired of this quibble about terminology ...

Is there any interest in discussing the issue, or was my guess two
years
ago correct: ham radio long haul networking is indeed a dead issue
now,
for exactly the reasons I predicted two years ago?

The recent posts by Greg and Steve seem to indicate I was right.

It's hardly just my area. This type of attitude is everywhere, even
on UseNet. How often do you see someone trying to ban someone from
posting just because he or she is saying something unpopular? If the
stories about his being banned from certain discussion groups is
factual, I suspect that Charles would have a strong opinion about
Lockout Lids indeed.

>Then again, in the absence of mitigating circumstances, "it's my station,
>and I'll decide who/what goes through it" can be a very awkward position
>to argue against.

"Mitigating circumstances" have nothing to do with it. I can and have
argued exactly that; it's my station and it's my decision what goes
through it. However, if you are *part of a network* you have an
ethical responsibility to that network, and to lock out legal ham
stations for anything but deliberate and continual violation of FCC
rules is NOT in the spirit of ham radio. One of those Lockout Lids
has no problem with using OUR system to forward his traffic, but we
are not allowed to use his nodes or BBS.

>Sorry to hear about your plight.

The sad thing is that it's not the object of the lockout who gets
hurt, it's all the uninvolved hams whose traffic and enjoyment of the
hobby is disrupted by these fascists.

I didn't say anything about "new technology." "New" has absolutely
nothing to do with this discussion. Books are not exactly new
technology, either, but I still enjoy reading.

>TAPR has always been focused on the development of packet techniques
>and technology. 15 years ago that was a BBS network, but that's past being
>a mature technology now, and TAPR has moved on. If you still want to play

I don't expect it to throw a useful system into the trash heap,
either, just because some few folks have decided that it no longer
holds any interest for THEM. In most areas, the BBS system is the
only network there is. If you want to abandon them, you'd better have
an alternative in place first, or you're going to lose all your
"customers."

Solution: make your radio links competitve, IE offer data delivery
with the high throughput and low latency demanded by the LAN/WANs
you want to depend on you. Can't do that? Then perhaps you are
witnessing evolution in action.

At one time I had high hopes for the HF forwarding network. But it has
become clear that those participating in it either can't or won't meet
the data delivery promises that they made to the LAN/WANs who
they asked to depend on them for that service. Thus the LAN/WANs
are turning elsewhere for data delivery. Should that be a surprise?
I think not.

Their RF connects directly to the internet at their ISP's "POP" ... that
the internet itself is "wired" is of no consequence, nor is it "bad" or "evil."

> > Hmmm... Hank, this might be breaking news to you, but "The Internet" IS
> > present in the Seattle area, at any number of Internet Service Providers,
> > corporations, universities, etc. Those are dedicated, high capacity data

>
> Oh. I thought you were talking about ham radio networks.

Hank,

He is ... up to the point where they connect to the internet ... and they
SHOULD connect to the internet, so that the rest of the world can be
communicated with ... and by "rest of the world" I don't mean "DX
countries," I mean "the rest of the digital networking world" ... the myriad
of other systems out there with services such as e-mail, NNTP, the WWW,
and a host of other useful things ...

> Who's wires are they?
> Common carrier? Private carrier?
> You strung them yourself?
> They are not wires but perhaps common carrier microwave?

Who gives a crap??? The rest of the internet (I say "rest" since ampr.org
is an inherent, though poorly connected, part of the global internet ...) is
primarily wireline carrier-based networks ... that's not "bad," it's just a
fact.
By connecting to that larger network, the value and utility of the amateur
network is multiplied greatly ... and we have the opportunity to provide a
very useful, needed service to the EMS folks by building the capability to
bridge outages in times of emergency ... IF we employ compatible techniques
and adhere to the global, defacto standard of the TCP/IP protocol stack ...
("mobile IP" is about to become a BIG thing in the commercial world ...)

Are you seriously suggesting that amateur packet should remain in isolation
from the remainder of the world community of networks???
(I hope not, because if you are, you just succeeded in convincing me that
you don't really give a shit about the future of amateur networking, but only
care about maintaining your "spot in the limelight" as a "BBS software guru"
... as someone who truly respected your contribution in that regard, I hope
that's not the situation, but it will require you to accept that the BBS
paradigm
is outdated and wasteful and it's time to move on to better things ...)

> > In the case of the Puget Sound Amateur Radio TCP/IP Group, we bring the RF
> > TO the Internet. The actual junction point is a major Seattle-area
> > Internet service provider.
>
> You "bring RF to the internet." What does that mean?

It means, if I've read things correctly, that they have an RF link all the way
to
the ISP's local ethernet (which, presumably, ties all his servers and routers
together at a central "POP" (Point of Presence) site, where the connection(s)
to the high-speed internet backbone are established (usually a *minimum* of
redundant T-1s, preferably T-3s) ... these internet backbone connections are
ALWAYS provided by a commercial carrier ... as I said, that's not "bad,"
that's simply the way the *rest* of the internet is built and operated ...

> > > What is the name of this ISP? Perhaps we can establish an RF link to
> > > it from down here in the Portland area. That would be whizzy!

You'd be better off to establish a link to an ISP in Portland and take
advantage
of the improvement in connectivity ... then you can use what you have to help
coordinate the activities of (and recruit) others to build high speed RF
backbones
between Portland and Seattle and other cities that would be your next logical
backbone hops in an RF-based mesh that can extend the network and bridge
outages in the existing wired parts ...

> > The name of the network is the Puget Sound Amateur Radio TCP/IP network,
> > also called WETNET. It's home page is at http://www.wetnet.ampr.org.
>>
> > > Steve, let us all know how this stuff in Seattle works.

It looks pretty impressive Hank ... I don't mean this as a put-down, but
it's a HELL of a lot more impressive than some outdated BBS paradigm ..
(I would not be honest with you if I did not express this, but I do not mean
it to be disrespectful ... as I said, I have respect for all the work that
you've
done and the contribution you made to the early years of packet, but it is
now time to move on to more modern and more globally compatible things.)

> > > Sounds very exciting that you have found a way to access the internet
> > > without using commercial wire networks (i.e. "the telephone").

If they are using RF links all the way to the ISP's internal ethernet as has
been described, they ARE accessing the internet without using commercial
wire networks ... once they hit that ethernet, they are "on the internet" or,
more accurately, their RF-based network in the ampr.org domain has been
seamlessly integrated as an integral part of the global internet ... that's the
way it was INTENDED to be years an years ago when packet was just a hot
idea in the minds of some experimenters and someone (Brian Kantor???) had
the presence of mind to grab the ampr.org IP address block for ham use via
radio ...

> > I didn't say without wired networks. I said without use of telephone
> > connections. That you equate wired networks with telephone connections is
> > badly mistaken and only confuses the issue. If you stick with the more
> > factual term of "wired networks", then this discussion would be moot.

The internet IS a wired network (for the most part) ... as I said above, once
the
RF reaches the ethernet at the ISP, it is connected to "the internet" ... Hank
seems
to be insisting that any connection to anything that's "wired" (the internet,
included)
is "impure" somehow and "sinful" and should be avoided by all "good hams."
This
is a narrowminded, backward, and Luddite-like view that would obstruct some of
the
most significant avenues for progress and attracting new interest to amateur
networking
activities ... I *hope* that I am missunderstanding Hank's view/intent here ...

> Why quibble terminology?
>
> Any place I use the term "the telephone" replace it with "commercial
> carrier facilities" if that will help you to understand what I'm saying.

Any connection to the internet is going to involve "connecting to commercial
carrier facilities" since that's what the bulk of the internet is comprised of
..
that doesn't make a connection to the internet "bad" ... but, it seems that's
Hank's postion ... I hope I am wrong WRT this and that Hank will clarify and
correct any misunderstanding of his view(s) that I may have ...

> > > Are there other ISPs doing this? Enlighten us please ...
> > >
> > > Providing Internet connections for the purpose of interconnecting Amateur
> > > Radio TCP/IP users? Undoubtedly! Worldwide, probably dozens.
> >
> >
> Oh. Now I understand. Some of us call these folks "Land Line Lids."

This, I am afraid, sounds like pure, unadulterated, dog-in-the-manger,
deer-in-the-headlights-of-the-18-wheeler jealousy/fear of something that
(Hank apparently feels) cannot be competed with ...

I am truly saddened to get the feeling that Hank is actively promoting obstructionism WRT the connection of ham networks to the global internet and the proliferation of modern networking techniques that are vastly superior to the outdated BBS/dumb-terminal-login paradigm ...

practical limit
> to how much we can bleed out of our users.

How many packet users in North Georgia??? Say 100??? (I'm betting
that there are a LOT more than that, but that's a nice round number ...)
So your $12k/year would be a lousy $120 per user ... and that's asuming
that you have only 100, but I'd bet there are at least several times that
many ... that's about half of what they're currently probably paying their
ISP for access ... a lot less if you spread that $12k over, say 3x100 users.
I don't call that "bleeding" the users ... I call that "the users getting a
bargain" and "the users paying their way instead of expecting someone
else to carry them ..."

> More importantly, there's a limit to how much
> *time* we can require from our network maintenance people in order to install
the network
> and keep it functioning.

I agree ... I've made (more than) my share of middle of the night trips to
remote mountain tops in the 4x4 to get some system back on the air ...
we need to design in more redundancy and remote diagnostics and
remote reconfigurability to make network service and management more
economical in terms of people's time ...

> TAPR is right, building and maintaining a viable national WAN is
> beyond our reach. We need to concentrate our limited resources on the local
LAN and
> MAN levels where we can make a substantial impact, and leave the national WAN
task
> largely to the wireline providers who have the resources to bulid and
maintain it.

I would agree that the LANs and MANs should come first ... that's where
we can provide the best services to the most people ... in the areas where
the user density is sufficent to support systems ... as you say, we can
dabble with the long-haul stuff once we have our LAN/MAN house in order.
In the meantime, I see NO "sin" in using IP encapsulation to "wormhole"

between areas where RF backbones are either non-existent or too slow and unreliable to be of practical use ... you have to walk before you can think about running ...

> We can use amateur satellites and HF to a limited extent to implement the WAN, but

> only marginal results.

What sort of thruput do *you* think we need for a practical thin-route WAN, Gary?
Would reliable, robust 9600 on HF be adequate for the near-term, in your view?

> On average, there are about 3,000 amateurs per state using digital communications

> a WAN needs to traverse have *zero* local amateurs to build and maintain it. This
> sparseness is the ultimate reason why a modern national WAN is impractical for
> us to implement.

Those sparse areas where the motivation for NASA's vision of a "mobile satellite
system" to augment cellular and conventional mobile radio coverage in the areas where the economics for terrestrial base stations/cell sites were questionable ..
I understand the problem ... there are several potential solutions ... better HF
thruput, satellites, and one other that I'd prefer not to mention until I give it some
more thought ...

> We have to make a choice. We can either have a very thin WAN, with extremely limited
> throughput and spotty coverage, or we can have a number of robust LANs and MANs
> with good performance, coupled together by the wireline networks. We don't realistically

In article <3396B9E7.1E27@onramp.net>, avvid@onramp.net says...
>
>BIG SNIP
>
>
>Go away..

Amen.

Anyway, I was on TCP-Group for over a decade before Charlie-poo trolled it. It was with TCP-Group's help that I designed RSPF, the only automatic routing protocol specifically designed for AMPRnet-style unreliable IP radio links. His behavior has been despicable. It's one thing to express a disagreement with something, but quite another to jump in from outside and let fly with personal insults, childish repetition of drivel like "landline lids" and "amateur telephone". Clearly his intention was to hinder the development of packet radio technology, since it was competing with his early-1980s BBS network. If you can't beat them with quality, vandalize 'em with flame wars, eh?

For the record, I disagree with Charles and Hank on technical grounds. We DO NOT HAVE THE BANDWIDTH OR MONEY needed to build an all-ham radio backbone at usable speeds. I admire what GRAPES has done concentrating on MAN/LAN while allowing cheaper "wireline" (mostly glass nowadays) to handle the WAN.

Modern computer applications aren't about ARRL Radiograms or other little BBS messages. AMPRnet should not be a recreation of the 1914 National Traffic System, which is what BBSnet is. Not that this was bad -- I admire Hank's work and the rest of them. But that's not all that amateur packet radio could or should be.

Wide-area bandwidth is hard to come by. Either you build a costly microwave network (it takes a LOT of hops to cover North America) or you use HF, which has dodgy propagation and very, very little bandwidth. At the same time it IS possible, however rare, to build radio MANs (one to two hops diameter) with decent bandwidth. So we may prefer to concentrate on the best POSSIBLE outcome, not some all-radio ideal that simply can't work well enough to handle applications that are more bandwidth intensive than NTS.

Charles refuses to accept the validity of this view, and does a Joe McCarthy on anyone who opposes him. Sorry, folks, but that's not cricket.
[note to readers -- I'm a 30+ year ham. A lot of us working the technical side of the Internet are hams. We appreciate both worlds for what they're good for.]

According to "Amateur Telephone" advocate Fred R. Goldstein :

> Anyway, I was on TCP-Group for over a decade before Charlie-poo trolled
it.

Obviously you weren't there when Brian shut it down, or just plain find it convenient to misrepresent what went on at tcp-group because it is too embarrassing to your "cause".

> It was with TCP-Group's help that I designed RSPF, the only automatic
routing
> protocol specifically designed for AMPRnet-style unreliable IP radio
links.

That's nice.

> His behavior has been despicable. It's one thing to express a
disagreement
> with something, but quite another to jump in from outside and let fly
with
> personal insults, childish repetition of drivel like "landline lids" and
> "amateur telephone".

I suppose that you think it's perfectly allright for TCP/IP fanatics (Internet Forwarders) to actively work to destroy the existing packet net, and the BBS forwarding net because " Fred doesn't like it".

Talk about creating a "Them and Us" situation!

I've always known you were one of the "Yes-Men" Greg Jones' likes to surround himself with. Nice to hear from you again, Fred.

>Clearly his intention was to hinder the development of
> packet radio technology, since it was competing with his early-1980s BBS
> network. If you can't beat them with quality, vandalize 'em with flame
wars,
> eh?

I've seen conjecture by several LandLine Lids as to WHY I bothered to visit the tcp-group. Nobody has tried to ask me, at least not in a decent fashion which might get a reply.

For those of you who are curious: I noticed that LandLine Lid stations were destroying the packet radio net. I noticed that they ALL ran tcp-ip to do the 'LandLine Lid" thing, where they route traffic intended for the packet radio network over Internet links.
Where do the tcp-ip people hang out? tcp-group.
I went there to find out what kind of mentality was capable of destroying

amateur packet radio networks and BBS links, CLOVER, Packet, PACTOR, AMSAT,
You name it., and THEN be ignorant enough to offer hams the Telephone
instead and call it "advanced amateur packet radio networking".

I found guys like Fred.

If ONE GUY could say ANYTHING to shut down an entire Internet discussion
group, what does that tell you about that discussion group.?? Think
about it.

It shut itself down. Don't bother to lie about it again, Fred. You look
silly enough, just being an Amateur Telephone advocate.

> For the record, I disagree with Charles and Hank on technical grounds.
We DO
> NOT HAVE THE BANDWIDTH OR MONEY needed to build an all-ham radio backbone
at
> usable speeds. I admire what GRAPES has done concentrating on MAN/LAN
while
> allowing cheaper "wireline" (mostly glass nowadays) to handle the WAN.

I've got news for you, bud. An amateuur radio link at 300 baud is
preferable to a telephone link at 56 kb.

Not to a TCP/IP fanatic, I'm sure.. I was talking about it's worth to
AMATEUR RADIO OPERATORS.

If you can't handle that, destroying amateur packet radio is not the
answer. At least not a decent, civilized one.

I've got more news for you, Fred. If what you are pushing was REALLY
better, there would be no need for this ANTI-BBS, ANTI-PACKET NETWORK war
you tcp/ip dudes are into.
If you REALLY had something better to offer, you could just OFFER it, and
it's natural superiority would "sell" it. It would slowly but surely tend
to replace older, less efficient systems.
The fact that tcp/ip fanatics vandalize existing packet radio networking
rather than concentrate on BUILDING their OWN systems says it all. All you
have to offer is the telephone, a lot of hot air, and a total disregard for
your fellow hams. (If they don't like FRED's system!)

Amateur tcp-ip fanatics like Fred do not know how to play well with others.

You are promoting vandalism. Proud of yourself, are you, Fred?

> Modern computer applications aren't about ARRL Radiograms or other little

You and your clique of LandLine Lid buddies can't work past the problem. You naturally assume that since YOU can't, no-one else in the future of amateur radio will be able to either.
No, we should BURY this problem, rather than admit we are not personally up to it... Hey!! We'll just use the TELEPHONE, and PRETEND it's radio! If we call it "advanced amateur radio networking", none of those idiots will notice the difference!

Morons. Of course hams will notice the difference. That's what's happening right now.

And they don't like what they are seeing.

> Charles refuses to accept the validity of this view, and does a Joe McCarthy
> on anyone who opposes him.

Let's see.. I refuse to agree with Fred, so I'm a McCarthyite now.. I guess that makes it OK for me to mention that Fred strikes me as being a bit short of a full load.. He gets on the telephone, and thinks it's amateur radio.

It's spooky... Brian Kantor of tcp-group's comment to me was "We will bury you".

I told him I didn't mind, considering the fate of the last ideoligy defended by that line. A few days later, tcp-group buried itself instead.

>Sorry, folks, but that's not cricket.

> side of the Internet are hams. We appreciate both worlds for what they're
> good for.]

Until you got confused, and decided that the Telephone was "good" for amateur packet radio. I don't care if you and Marconi made tjhe first spark transmitter together .. Past accomplishments do not make it "OK" to be a vandal now. Straighten up your act.

The malaise which has affected Amateur Packet Radio over the last few years has manifested itself in several ways. One glaringly obvious problem shows, in that "running down" our current network in public has become so popular and acceptable in recent years among the "movers and shakers" of Amateur Packet Radio networking.
First the advocates of high-speed, then the devotees of amateur TCP/IP have lined up to sing an unbroken chorus of whining, complaining negativism, all aimed at the Amateur Packet Radio network and it's users. This has been going on for several years now. You don't have to be a motivational phychologist to know that when people hear their own "leaders" regularly disparaging and denigrating their efforts, they will tend to lose interest and lose heart. Sure enough, the quality of our "leadership" has fallen somewhat, and the packet radio community in the U.S. suffers to this day.

The depth of this malaise can also be seen in the pathetic, desperate attempt among amateur TCP/IP devotees to legitimize "radioless ham radio".

These people have discovered that TCP/IP can't hack it as an Amateur Radio networking application, but they will not let it die a natural, honorable death.. In fact, they are perfectly willing to use the telephone (Internet) for the bulk of their communications and PRETEND it's amateur radio, just so long as they can go on using "amateur TCP/IP"...
Weird, pathetic, and twisted, but true! "Radioless Ham Radio"!?! ;-)

It gets worse...

A sub-clique of these same "hams" are deliberately using Packet/Internet gateways to move Amateur Packet Radio traffic over the Internet instead of over ham radio links. This practice of "Internet Forwarding" serves to "route around" and replace the radio links of our digital network's "backbone" with telephone links needed and wanted only by amateur TCP/IP. The stupid thing about this is that given that these "hams" MUST use the telephone for their "networking system", there still is no rational justification for their vandalism of the existing Amateur Packet Radio network in order to do so.

It's not like Amateur Packet Radio would compete with them for telephone access... No, the competition they REALLY fear is in simple legitimacy. The amateur TCP/IP "amateur telephone" network will never be impressive to hams as long as there is a genuine RADIO-based, global digital network to compare it to. Even LandLine Lids realize that "My telephone is faster than your radio" is not an impressive bragging point among hams. Compared to a real amateur radio network such as we still have, amateur TCP/IP with it's utter, abject dependence upon the telephone is laughable. It's supporters are painfully aware of this fact. -- And what is their reaction to this?

These people (I won't call them hams again, to avoid confusion) intend to see to it that the existing independent amateur radio network is undercut and dismantled, so forcing hams into an utter dependence upon the telephone and amateur TCP/IP. They are quite aware that hams would NEVER voluntarily do any of these things, so they attempt to FORCE us by working to destroy the packet radio network we have built. They attempt to destroy it from within.

Amateur TCP/IP devotees constantly run down the packet radio net, say the BBS forwarding network is no good and that the average packet user is a dope.
Then, these same people insist on being a "part" of that same BBS forwarding
network.?.!.? Then, it turns out that their "amateur TCP/IP BBS" stations use telephone links instead of radios, which cause existing ham radio links to die off while ensuring that new radio links do not come online...

Get it?

Their goal is to eventually leave packet ops NO alternative to amateur TCP/IP
and "radioless ham radio", and this represents the first really serious attack upon Amateur Packet Radio in it's short but impressive history.

If you examine the rhetoric of "Internet Forwarders", you will hear many references to "advanced technology", and the "new links" they provide..
To understand where they are coming from, simply replace those phrases with "the telephone"... This is no exaggeration!

That's ALL amateur TCP/IP has to offer; Without the telephone, it's a dead duck. Not lame; Dead.

There IS NO global amateur TCP/IP Radio network. None at all. These people want to tear down all that we have proudly done with radios, HF, H-S VHF/UHF,
AMSAT, ect, and have NOTHING to offer in return except utter dependence on the telephone for the bulk of our communications.

They kinda missed the general point of Ham Radio, if you get my drift..
It's not just that we use radios.. We use radios and we don't deliberately do things to lessen the enjoyment of other hams. In other words, we at least
pretend to be gentlemen, sincerely devoted to furthering the cause of Amateur Radio.

The idea of deliberately destroying the existing global amateur radio digital
network, to replace it with telephone links is not my idea of advancing amateur radio, folks.

The idea of using the telephone to "route around" the dedicated hams who have moved our messages with radios so that their efforts and expertise are no longer wanted or appreciated does not strike me as gentlemanly conduct, either. It's a deliberate action which most assuredly has lessened the

enjoyment of many really great hams. Most of these displaced hams are BBS SYSOPs, by the way... Routed around with telephone links, and rudely cut out of the BBS message forwarding network by thoughtless anti-ham-radio LandLine Lids whose final aim is to destroy the Packet Radio BBS network altogether.

That's right; The pioneers of the Amateur Packet Radio network who have done
the very most to bring about it's amazing development and worldwide growth are now being rudely displaced by a sub-clique of anti-ham TCP/IP Lids with telephones. Disgusting.

Several suggestions for eliminating the "LandLine Lid" problem have been put
forward. The most popular idea is to simply cut them out of our forwarding links by refusing to communicate with them. I don't feel this will prove to be effective. It won't really eliminate the problem, and it will do nothing to prevent future problems. The temptation will tend to increase rather than
decrease as Internet access becomes more commonplace... Let's nip it in the bud right now.
My personal leaning is toward a formal request for protective legislation against this specific problem, such as several other countries already have in place. Where Packet/Internet gateways are simply illegal, they have no LandLine Lid problem of course, and their Amateur Packet Radio networks have
continued to advance and grow while ours has been mired in this "radioless ham radio", amateur TCP/IP mess which has actually REVERSED our growth.
If we demand and obtain similar legal protection, the Amateur Packet Radio network in the U.S. will never again be menaced or endangered by LandLine Lids of any description, TCP/IP or otherwise.

I think it should be fairly obvious that a Radio-Only rule for "*** primary routing and transport of amateur radio network traffic ***" would tend to push us in the desired direction - that of addressing our problems by developing new, innovative ways to utilize RADIOS.
Also, by phrasing the regulation (roughly) in that manner, Packet/Internet gateways would NOT be outlawed, and could still provide a highly beneficial interface and data exchange point between the two networks. They would only be restrained from using the telephone links to transport messages intended for the Amateur Packet Radio network. (Internet Forwarding)

This would instantly transform Packet/Internet gateways from the parasitic liability they are today into an especially important ASSET to the Amateur Packet Radio network, with unlimited potential. You don't hear about these kind of applications right now because they do not fit in with the agenda of our present "leadership". Eliminate Internet Forwarding, and the Packet/Internet gateway will have a chance to mature and develop as an Amateur Radio application, and of course then there will still be an Amateur
Packet Radio network for them to interact with and be a part of.

Yes, you heard right; I'm saying that Amateur Telephone is just as big a drag on amateur TCP/IP as it is on mainstream packet. If amateur TCP/IP is EVER to mature and gain any status as an amateur packet radio application, then "Amateur Telephone" will have to be firmly placed aside and left behind.
We NEED that pressure to solve our problems by being more clever in our use of radios, if we are to see rapid advancement. Giving up and going over to the Internet is not how you advance the art of using radios... It's how you give up, no matter what way it is rationalized later on.

As a BBS SYSOP, my suggestion to you is that we take rapid, effective steps to regain our network from these persons. I also would like to suggest that BBS SYSOPs have contributed much, much more to Amateur Packet Radio than all
the world's "packet experts" and amateur TCP/IP devotees combined. We, more than any other group are responsible for Amateur Packet Radio's amazingly rapid growth and worldwide utility as an independent, all-ham radio messaging network. When LandLine Lids disparage our activities, they have to do it on OUR network or the Internet because THEY can't hack building one of their own,
as we have.

The point: Don't take any crud off of LandLine Lid parasites who don't even
HAVE a network.

Don't take any more of being "run down", don't take any more whining complaints, don't take any more vandalism of OUR network!

Comments, fellow Hams and SYSOPs? Don't you think it's about time the HAMS on the packet RADIO network pulled together a bit, so we can get past this problem and
resume building and improving our network?

The idea behind broadcast servers is that each bulletin is sent *only once*
on the LAN instead of being sent repeatedly as each user who wants to read
it requests a separate copy of it. This makes a *lot* of sense. It reduces network
loading as much as a hundredfold. It is not unusual for the same bulletin to be
downloaded by 100 different LAN users. By downloading it *once* to everyone,
we reduce redundant LAN traffic sharply. If a particular bulletin is only downloaded
by *two* users, it is still a net savings to broadcast it.

Now you're assuming that most people only download a small fraction of the
bulletins. That may be true in your area, but here lots of people read everything.
(Though that would likely change if we had WANs with the capacity to deliver
larger volumes of messages.) So every bulletin gets sent over the LAN at
least once *anyway*, and more likely several times. I'm less concerned by
disk space than you are. Disks are cheap today, and those with smaller disks
can use a more aggressive expire to keep space requirements small.

Note, email is a separate issue of course. It demands prompt end to end
delivery to only one recipient and isn't suited to the broadcast paradigm.

>If the network is reasonably fast and reliable, there is no need to
>store all the bulletin bodies at the local node, you could have a few
>larger nodes with more disk capacity to store the full news feed or
>even have one big node for electronic homebrewing, one for newsgroups

>the local node from the big node, the bulletin body would also be
>stored in a cache or proxy server in the local node and could be
>retrieved quickly, if some other users requests the same bulletin
>body.

Now this isn't a bad idea, but we can incorporate it in the broadcast paradigm. It may be that some bulletins hold no interest for *anyone* on the LAN, in that case they need not be broadcast *even once*, or even downloaded from the MAN or WAN to the LAN server. By broadcasting just the headers first, and then queuing for broadcast only those bodies which have requests, we reduce redundant traffic even more. (This is starting to look like an extended and modified form of the Pacsat protocol.)

The idea of storing bulletins in a distributed fashion thorughout the network is also a good idea. The broadcast idea minimizes traffic on the LAN, and the idea of distributed storage can minimize the traffic on the larger network. Some bulletins might not make it past the MAN, or even the WAN, if no one requested to read them. Even with a fast WAN, however, we lose a good deal of immediacy due to network latency for the first request.

This distributed storage idea is more akin to webpages and the www than it is to the distribution of bulletins ala usenet, however. The www isn't a bad paradigm either, but long latencies can kill it. With the present dismal state of the RF WAN, particularly at HF, this won't play on a more than localized scope. (For those moaning about the demise of the HF network, this is why. The way it is done now, it can't provide the services or the latencies LAN users are demanding from inter-LAN transport systems, thus they've been forced to turn to the wirelines to interconnect their RF MAN/LAN systems.)

>However, broadcasting the bulletin (or just the bulletin headers)
>requires that the user system is constantly (24*7) on-line and that it
>uses a multitasking operating system that does not crash every day.

Of course, the Microsoft virus need not apply. :-)

If we're to have more than very primitive toy network services, we have to have 24x7 connectivity and multitasking support. Fortunately, that's easily within reach today. A minimal Linux system is ideal. Even a JNOS system on an old DOS PC can serve after a fashion as the gateway to the user's internal LAN.

>With multitasking operating systems and having a constant network
>access from/to the packet radio net is a security risk, if the
>computer is used for anything serious (such as balancing your
>finances). While many multitasking operating systems _can_ be made

>quite secure, this may require a lot of expertise that the end user
>might not have.

It is something he needs to acquire. If his computers aren't connected to
the packet network, they are likely connected to the internet in some other
fashion. Computers are only going to become more networked as time
goes on. That's a fact of life every computer user is going to have to face
sooner or later. We might as well face it squarely now.

>IMO, the truly distributed computing over packet radio concept is
>viable when most end users can dedicate a computer (minimum 386) for
>the packet radio applications.

Using such a minimal computer as a firewall between the packet network
and the user's home LAN is a viable option, and one I use myself. Fortunately,
such a minimal system is dirt cheap today, often obtainable by dumpster diving.

Locally, we were kicking around the idea of incorporating a minimal router and
ethernet interface directly into the 56 kb RF modem this morning. That would add
about $150 to it (one of us is working on embedded home networks and has reduced
the router and ethernet chipset to a managable size and cost to be placed in the
modem as a daughter board). This could then serve double duty as the firewall for
the user's internal LAN.

This got started because we wanted to easily interface the modem to a laptop for
mobile use. We could do a PI card for PCMCIA, but the more we thought about it, the
idea of a direct ethernet interface began to look better and better. Then the laptop user
could use the PCMCIA ethernet card he already has. It lets Macs and Suns play too.
And it deals with the home user's local LAN as well.

Note well this isn't a product announcement, just something with which we're doodling.
Is anyone interested in having something like this? What would you think if we incorporated
a PCMCIA slot into the modem instead? That would allow you to use your own ethernet card
in the modem. Or you could use a PCMCIA telephone modem as a bridge to a remote site's
RF modem. Or would you rather have the ethernet interface integrated directly into the
modem?
That would be a bit cheaper in toto than providing a PCMCIA slot and requiring you to buy
another PC card, but it reduces flexibility a bit. Or are you satisfied to have a RS-422
link to
a PI card in your desktop PC?

Frankly, I think mobile/portable packet is going to become the next hot thing at the LAN
level.
We need better than 1200 baud to make it really useful, but our higher speed options
currently
interface to ISA cards, and our laptops don't have ISA slots anymore.

I agree with all that, but I think our packet network needs higher speeds
than 9600 baud. In your example, you ran a leased line point to point
between LANs to serve a small number of users. But that's not the
architecture we have in packet. We need many hops to get from one
LAN to another in many cases. That adds huge amounts of latency.
And we have the combined traffic of many LANs trying to use parts
of the same backbone paths and that adds volume.

It seems to me that we need to attack this problem from two directions.
We need faster basic rates to handle high volumes and to reduce latency
somewhat. And we need fewer hops in order to reduce latency much more.
The latter can be somewhat slower than the former and used specifically
for packets demanding low latency (we need to implement the class of service
flag in our routers so that they can intelligently choose the appropriate paths
for routine bulk data transport and for data with low latency requirements).

This latter is where I've always thought HF could play a role. It obviously
doesn't have the capacity to handle the volumes of data we'd like, but it
can reduce hop counts enough to improve latency for those applications
requiring interactivity. Alas, HF networking seems to be stuck in the BBS
paradigm and is thus a non-starter at this point.

Latency is measured in days instead of milliseconds, routing is a horrible
non-standard static kludge, and reliability is poor. Yet many of those involved

don't seem to even realize the problems, or want to work toward solutions to them. It is little wonder that they are seeing reduced demand from the MANs and LANs for their services. A thin low latency WAN could be very valuable to packet networking, but no one involved in HF packet seems interested in addressing this. Instead we get diatribes about how they are being bypassed. *Of course* they are being bypassed, they aren't delivering the services people at the MAN and LAN level want and need today.

It doesn't *have* to be that way. If the HF forwarders would start thinking in terms of providing the low latency thin WAN services needed by the MAN and LAN, they could resolve this issue. There are techniques which could allow them to do this, but they'd rather whine and bitch than work toward implementing them. (Note, this is not true for all of those wanting to provide HF packet services to the MAN/LAN, but it is certainly true of some of the more vocal ones posting here recently.)

Sigh.

[more snip]

>> [note to readers -- I'm a 30+ year ham.

I am a nearly 40-year ham ..

.. and I well remember when we all used AM.

Then this new-fangled SSB thang appeared on the scene. The arguments
that SSB "wasn't ham radio" were exactly like the arguments in this
thread: luddite and futile.

Fact: There is no way that hams can *afford* to build a universal all-
radio packet network.

Fact: There is no way that hams can *organise themselves* to build and
manage a universal all-radio packet network.

Fact: The Internet is here. It works, hams can afford it, and hams like
it, for ham-related reasons and non-ham-related reasons.

Fact: The best way forward is to integrate radio with the Internet.

We should use radio where it makes sense. We should use the Internet
where it makes sense. It's horses for courses, and there's room for both
in our tiny (minded) ham world.

If this means that some people want to stick with 300 baud and Victorian
BBSs with beautifully carved polished legs, then so be it. But they
shouldn't stand in the way of others who want to experiment with new
fangled things.

We don't need people to walk in front of us with a red warning flag any
more.

When I first got on packet, I was locked out of the local BBS. I read
most of the bulletins by saving the buffer to disc and reading it
later. Get the software to automate and organize this, and it'd be an
excellent plan. No additional hardware required, probably.

We've got several folks running mobile packet here, although it's used
primarily for public service events. I've chatted with several folks
while they were mobile, but it's kind of rare to have both a driver
and a ham operator available in the same vehicle.

Could it be because the luddites at the ARRL, and among current HF operators, have vehemently opposed legalizing SS on HF? Hmmm, could be. The military has faced no such legal barriers, and guess what, their HF SS systems *do* deliver.

But lets get right down to the nub of this issue. You are whining because you are losing your user base. Did you ever consider that's happening because you aren't delivering the services the LANs and MANs want? Of course you haven't, because that would mean *you'd* have to do something to fix the problem. So instead you get on here and whine and attempt character assassination of the people who are working to meet those needs.

The great bulk of packet activity is not on HF. It lives in the MANs and LANs. You are the tail attempting to wag the dog. If you are really concerned about losing your user base, then get busy and find ways to meet the needs of the LANs and MANs for WAN services. Then they'll stick with you. But don't expect them to restrict their activities or lower their expectations in order to subsidize your inefficient activities.

Due to the archaic nature of the amateur radio digital network, we have enjoyed a relative freedom from "Lockout Lids",. There were so many routes that censors were "routed around" without any particular effort on anyone's part.

The "Internet Forwarders" have now introduced widespread censorship to the amateur packet radio network for the first time, "Locking Out" myself and any other hams whose opinions they may disagree with. They have managed this feat by reducing the number of amateur radio linkages while they added telephone links they can control. The more hams they shut down and replace with telephone links, the better their ability to play "thought police" with the amateur packet radio community.

It didn't take them long to take advantage of this ability after arrainging it, did it? These folks fell right into repression and censorship as if it fit them like an old comfortable shoe.

If you have not seen my bulletins on packet lately, think about how wonderful it will be when YOU are censored for not agreeing with this clique of "Internet Forwarders". I've been posting bulletins, but hear no replies or comments. This will last precisely as long as it takes to get my HF rig out of the shop. I'll be damned if I'll let a group of LIDs censor me or anyone else in the north Texas area. Radio is freedom, folks. Remember that.

If you do not want this new, internet-like trend to grow and take hold in the packet net, this is a good time to take action. Make a stink about it. (Somebody list known Internet Forwarders' Packet and E-Mail addresses please.)

Who do these folks think they are, introducing wide-scale censorship into the amateur packet net, based on a personal opinions? Real BBS SYSOPs censor on the basis of legality only. (With a few moronic exceptions of course - I speak of the rank 'n file .) Internet forwarders are doing it on an organized, widespread basis according to LandLine Lid Karl, K5DI in New Mexico. (One of Greg Jones's pet LandLine Lids whom he has reserved the TAPR BBSSIG for.)

Internet Forwarders....

They destroy radio links and offer hams the telephone instead...
They introduce organized, widespread censorship to amateur packet radio.
They denigrate the BBS net, but insist on being "part" of it.
They are QUITTERS who have given up on Radio.
They rationalize vandalism as an act of progress.
They do not play well with others.

They show no respect for their fellow hams. (If those hams "do" something different.)
They are parasites upon real networks such as Packet or the Internet.
They are either unwilling or unable to build a global Ham Radio network of their own.
They show a preference for destroying the work of others over the idea of working to better themselves.

Do we REALLY need to debate whether the agenda these folks are pushing is worthy of amateur radio?

If they really had something on the ball, , they would build and compete instead of striving to denigrate and destroy.

Yes, I run down what these persons do. You betcha I "run down" vandalism, repression, and censorship.

There is no rational excuse for "Internet Forwarding". It damages the BBS network, and "SYSOPs" who don't care about this point should not be in that network in the first place. There IS NO honorable or decent reason to purposely destroy what others do simply because you disagree with it. If you follow the responses of LandLine Lid advocates, you will see over and over again that many of them do not even understand this simple principle of decency, much less agree with it. It whizzes right over their heads as if it had never been mentioned.

There ought to be a law... Obviously they have left both reason and common decency out of their considerations. -- How long should we continue to act as if they were worthy of our respect as hams?

We should go ahead and sic the LAW on them. That's my advice. New regs.

Well, since you have failed to meet the data delivery needs of those you promised WAN service, I have no problem with people finding alternative methods for interconnecting amateur radio LANs and MANs when you won't meet their needs. We've upped our on-air performance 47x in the last 17 years (and we're working on jumping it another 8x), what have *you* done to meet those expanded data delivery needs? Well? That's what I thought, not a damn thing. You're too busy whining.

>radio.
>
>That's why they call them "LandLine Lids".

Funny, I don't need to prefix the word landline to what I think of you. It's true we use TCP/IP,
and we might even decide to use ATM when we start moving digital video around, but we also support legacy Netrom, and we're doing it over *amateur radio*, 56 kb LANs, MANs, and some WAN trunks to be exact, not telephones. And know what? It works *fine*. We even use it over some thin 1200 baud legacy links. Those work fine too, though lots slower of course.
But we don't have any dropped or lost messages, and we don't need 3 days to deliver them either.

But BBS LIDs like you can't seem to make it play. Why is that? Is it just ignorance? Or perhaps it is gross stupidity? Somehow from the tenor of your comments here so far,
I tend to think that in your case it must be the latter. Why aren't you using frequency agile

ALE techniques? Why aren't you using link encapsulation? Why does it take you 3 days to forward a message between MANs 300 miles apart? Well?

You promised WAN service to the LANs and MANs. Now you can't deliver. Are you trying to fix the problem? Hell, no! All you can do is whine, whine, whine. Re-engineer your network up out of the dark ages and deliver the WAN services you promised and your users will come back. Keep doing the same tired old things in the same inept old ways and your users will continue to abandon you. And know what? I don't blame them one damn bit! Maybe after you give up we can find some people who want to do WAN services right. In the meanwhile we'll continue doing amateur radio packet at the LAN and MAN level, and if we have to, we'll use internet wormholes to reach out to other areas because you and your cronies AREN'T DELIVERING THE WAN SERVICES WE NEED. And frankly you haven't been doing so for quite some time now. Our patience has run out. If you won't do the job, we'll find another way.

It is very very clear that you are either unwilling or unable to clean up your own mess. All you can do is try to foist the blame for *your* failures off on someone else. You've failed to keep up with the bulk of packet radio, and now you're paying the price. If you think you'll stop the progress and innovation we're achieving at the local levels with your attacks on Greg and TAPR, you are sadly mistaken. You're just making yourself and your cronies look more and more ridiculous.

Steve's been at the cheap beer again...

I shouldn't be so hard on Steve.. His ignorant, radical comments have always served very well to illustrate the essential barrenness of the "Amateur Telephone" advocate's position.

Quite a barker! ;-)

Steve, could you tell us all how the packet net is so bad again, please? Show us how good you are at nenigrating amateur packet radio and you're fellow hams. Heck, I'll even chip in a couple of bucks for another case of that cheap beer.

On what planet??? This is absurd, Charlie, but it's ALSO not
to the point ...

> Not to a TCP/IP fanatic, I'm sure.. I was talking about it's worth to
> AMATEUR RADIO OPERATORS.

Many very good amateur radio operators also feel that the TCP/IP
protocol stack has many advantages, not the least of which are
global acceptance/compatibility, ease of interface with the *rest* of
the global intenet, and the richness of applications it's capable of
supporting.

> If you can't handle that, destroying amateur packet radio is not the
> answer. At least not a decent, civilized one.

Nobody is destroying amateur packet radio, except perhaps cretins
like you who insist on trying to keep it stuck in some kind of Luddite
time warp ... the dumb-terminal-login/BBS paradigm has been passe
in most of the mainstream world for many years now ... wake up and
recognize that what you're trying to constrain amateur packet radio
to is fatally outdated ... YOU and others like you are the ones who
are "actively destroying amateur packet radio" by trying to force it to
be so "pure" that it remains isolated from the rest of the world networking
community and becomes virtually useless ...

>
> I've got more news for you, Fred. If what you are pushing was REALLY
> better, there would be no need for this ANTI-BBS, ANTI-PACKET NETWORK war
> you tcp/ip dudes are into.

All they're really doing is declining to participate (by wasting their time, $,
and
other resources) in proliferating your backward vision of what a "network" is
(which is really a bunch of stupid BBSs) ... instead, they are actively working
on building much better things and happen to have the gall to mention it and
point out the flaws in *your* methods to others ... too bad for you ... as I've
said, I can appreciate the queasy feeling that must give you ... sort of like a
helpless deer in the headlights of a speeding 18-wheeler ... I can practically
hear the "splat!"

> The fact that tcp/ip fanatics vandalize existing packet radio networking
> rather than concentrate on BUILDING their OWN systems says it all. All you
> have to offer is the telephone, a lot of hot air, and a total disregard for
> your fellow hams. (If they don't like FRED's system!)

Providing connectivity to the remainder of the global internet is NOT
"vandalizing" existing packet radio networking, it is enhancing the
services available to our LANs and MANs in ways that you could
NEVER compete with with your dumb-terminal-login/BBS paradigm.
THAT is what bothers you ... that someone IS doing something that
outshines you and, like some almost-extinct dinosaur, you can't
figure out how to retain your dominance over your realm ...

Face it Charlie, you're a jealous, bitter troll who's "claim to fame" (if
you ever had one) is in danger of extinction because of the natural
evolutionary progress that's occurring in the real world around you.

Take your acidic attacks on those who are actually *doing* things
for the better and go to hell ...

>system on an old DOS PC can serve after a fashion as the gateway to
>the user's internal LAN.

Technically, you're correct! (again.. you have a very good
reputation for that.. chuckle)

However, from a practical standpoint, I wonder if the entire
scenario isn't like 'the successful operation in which the
patient dies!'

You're in the consulting business.

What chance do you really think there is that the *average* ham will
have the capacity to use LINUX? Heck DOS was bad enough we had to
to have Windows to kiss, followed by OS/2, the training ground we've
served whereupon we will finally get the other half as NT... :)

Worse, a few of us will have to co-opt the job of embedding a really decent subset of one or more of these into cell fones before we will ever see any HT's with the necessary horsepower to make a really useful platform for all that is being bandied about here!

<chuckle>

>It is something he needs to acquire. If his computers aren't connected to
>the packet network, they are likely connected to the internet in some other
>fashion. Computers are only going to become more networked as time
>goes on. That's a fact of life every computer user is going to have to face
>sooner or later. We might as well face it squarely now.

I still maintain that the interconnection won't reach critical mass until you can speak into your HT and *DO* something useful with the interconnectivity with it.

The problem is that most hams are all talk.. Not said critically, because the prime purpose of ham radio is to communicate, followed by the requirement we inovate!

What is *realllly* needed is the abililty for us to *talk* in such a way as to *command function*, remotely, as well as at the desk.

When *that* tool surfaces in our ranks, I believe you *will* se a revolution in networking in ham radio...

Speaking toward it and the de-minimus systems, I think it no philosophical accident that the first voice commanded cell fone system showed up in the Lincolns, As I understand life, a de-minimus kernal of OS/2 is in every Ford vehicle made in the world today. Yes, I know apple had voice I/O long ago, but you can't market from a closed shop and at that point, memory was too expensive and chip densities weren't high enough for their survival with the overhead needed to bring it,

Peter Drucker said it best, I think, when he commented that there has never been a case in technical history where the innovator of a technology has ever been the dominant supplier!

>>IMO, the truly distributed computing over packet radio concept is
>>viable when most end users can dedicate a computer (minimum 386) for
>>the packet radio applications.

Not when you see that the voice command platform is where it will have to be to motivate real use of all this. You can set your destruction engine afloat here, but we will *not* likely see any 386's processing the voice to drive it. It is obvious that even a 396 can handle all the message traffic a user could drown in from a text standpoint and that graphics text is of second priority. However digitized voice is not.

>Frankly, I think mobile/portable packet is going to become the next hot thing at the LAN level.

>We need better than 1200 baud to make it really useful, but our higher speed options currently
>interface to ISA cards, and our laptops don't have ISA slots anymore.

I spent a good deal of time carrying a laptop in the vehicle
nearly three years ago doing mobile packet.

The voice of experience speaks.

Trucker said, keeping the little one in your britches is
EASY compared to keeping the big one 'tween the ditches!

If you think the accident rate is equal between cell fone users and
drunks (which it is!), wait until you try a KEYBOARD while driving.

The effects are simply STUNNING... pun intended. It's
REAL virtual reality, mon...

We have the full mobile packet law enforcement program going
on here at Texas A&M University using co-opted Motorola trunkline
channels. The research patrol cars are neat. The Texas DPS
officer who is the publicity agent for the project spoke at
the Bryan Amateur Radio Club annual banquet two years ago and
demonstrated the system's paper show. I focused the time-sharing
problem to him as an after paper question.

The human interface problem has *not* been solved.

Agreement was reached, at least that night, before the crowd,
that it *can't* be solved unless the vehicle operator can command
and control the system by voice.

Which is precisely one of the reasons I've stayed with OS/2
and am working my heart out to get my version of it...

done.

>>>>HTTP servers I believe will prove to be a passing fad... Packet is not

>>>>only on Internet gateways and that on the Internet side.
>>>
>>>I tend to disagree. I think browsers, web pages, and the like will become
>>>common on amateur packet if we increase the basic performance of the
>>>underlying network so that it can support their use properly. At 56 kb and
>>>above, browsing the amateur network is little different from browsing the
>>>internet with a good connection. And being able to seamlessly integrate
>>>text, images, and sound bites makes the amateur network much more
>>>rich and useful.

Precisely correct, in my view - but when I can tell my HT what
to do and the screen dumps all the needed video back to me.
Of course the HT is only a remote link to the desk, the desk
will be interactive as well... :)

>>I think that the http concept is a good idea for packet radio,
>>provided that the network latency times can be reduced drastically.
>>For mainly text based applications a 9600 bps full duplex backbone is
>>quite enough for quite a lot of users.

Beautifully said.. We have as many as 65000 *TOTAL* radiology
TEXT records stored in less than 1GB for six years of the entire
life of one radiology department in *TEXT*

Even a whole page of text is trivial at 9600 baud!

>I agree with all that, but I think our packet network needs higher speeds
>than 9600 baud.

Yes, and... that will probably mean the shift in *LOCAL* RF
data needs to even the spread specturm technology...

if nothing else, just to avoid the collider problem!

Again this is a whole paradigm shift in technology that, in
my opinion awaits us as hams....

>It seems to me that we need to attack this problem from two directions.
>We need faster basic rates to handle high volumes and to reduce latency
>somewhat. And we need fewer hops in order to reduce latency much more.
>The latter can be somewhat slower than the former and used specifically
>for packets demanding low latency (we need to implement the class of service
>flag in our routers so that they can intelligently choose the appropriate paths
>for routine bulk data transport and for data with low latency requirements).

As I see it, the ham crew will focus out exactly llike everyon else.

You will see things that are fixed tied together with switched
digital services. It is the only way to economically equate
service with distribution costs.

You will see things that move tied together with RF, in local
or cell-like service.

Your mobile and HT must become an extension of first *your*
home station and *next* the big wide world of net...

for the ham radio world of the future to have the
sizzle to attract the next real wave of use and
growth in our ranks.

>This latter is where I've always thought HF could play a role. It obviously
>doesn't have the capacity to handle the volumes of data we'd like, but it
>can reduce hop counts enough to improve latency for those applications
>requiring interactivity. Alas, HF networking seems to be stuck in the BBS
>paradigm and is thus a non-starter at this point.

Posh, as a personal opinion..

HF will become a vast wasteland..

Here comes digitall broadcasting radio..

The next wave of DBS dish TV only has
5000 channels! Caveate Surfor!

Who needs HF when you have strobed connection
ISDN Tel-Net on a command file batch driven basis?
Simply gateway that on an automatic basis to the
local spread spectrum ham radio MAN.

You might even use one of the new 6 watt public
channels for the carrier..

<giggle>

>It doesn't *have* to be that way. If the HF forwarders would start thinking in
>terms of providing the low latency thin WAN services needed by the MAN

>implementing them. (Note, this is not true for all of those wanting to provide
>HF packet services to the MAN/LAN, but it is certainly true of some of the
>more vocal ones posting here recently.)

Purely humor here Gary.. you know my posts from another place..

HF is dead. Where are the gravediggers coming to bury him?
I do not see them. Where is the smell of him?

Even my non-relative Martin wouldn't have a chance to steal that
line in a posting of 66 thesis on this subject!

>as it's working fine on my other TNC.

At a guess you are using a PC fitted with a 16550 UART and running the link between the TNC and the PC at a speed greater than 2400 bps? The problem occurs when the TNC's input buffer gets full - a couple of characters are lost. To the best of my knowledge, it only happens with Ka TNCs.

The solution is to run the link at 2400 bps. Seeing as you are using 1200 bps on air, you won't lose any performance by reducing the link speed.

The only other possible causes are that you are either using a cable in which the handshaking lines aren't connected, or you haven't enabled hardware handshaking. However, that would affect all TNCs, not just the KPC3.

Hi! Brian here.

Just a brief message to let users know that FTV release 0.98g now decodes:
WEFAX - FAX - SSTV (including colour modes) - RTTY - CW

Note: Only FAX and SSTV modes support transmission.

FTV is available for downloading at:
http://www.geocities.com/SiliconValley/2504

Check system requirements on my web site before downloading!

73's from Brian.

Your bulletin forward must be quite limited :-). We get bulletins in
many languages and those in more exotic languages do not receive much
attention. It takes a few hours a day for the dedicated 9600 bps
simplex backbone to deliver these bulletins. It is hard to imagine how
long it would take to read all these over the "1200 bps" user port
:-).

That is an interesting idea. And if you put a 10baseT interface on it,
the network cabling is easy to hide away. You could put the radios and
the modem in the attic and only bring down the 10baseT cable. This is
in particular neat if you are using 1.3 GHz or higher bands, so you
have to install those thick coaxial cables only into the attic.

>And we have the combined traffic of many LANs trying to use parts
>of the same backbone paths and that adds volume.

You are of course right that the latency is huge in a multihop
backbone if it used in the traditional way receiving the whole packet
before passing it on to the next hop. However, if the intermediate
station operate as full duplex bit repeaters that just does the bit
clock separation (which most likely is mandatory for a multihop link)
and bit regeneration and just do error checking at the end of the
multihop link, even 9600 _might_ be usable. There are, however,
several problems with this approach, you can not insert or extract
data at the intermediate stations and the RF quality of each hop must
be quite good, in order to get most frames through _all_ hops at once

without errors. Some forward ECC processing could be used at the end stations to increase the probability of getting the frame through without retransmission, thus compensating for random errors in the hops. Collisions should not occur in backbones if the frequency coordination works properly (although there might be problems due to tropospheric lift).

I admit that due to the extra cost for full duplex operation (extra antennas for crossband or duplexers for single band duplex) it does not much sense to use only 9600 bps, when the extra cost for 56k/64k is marginal, compared to the total cost of the station.

>
>It seems to me that we need to attack this problem from two directions.
>We need faster basic rates to handle high volumes and to reduce latency
>somewhat.

The great advantage with higher raw bit rates is that we can afford frame level store and forward without the latency skyrocketing, provided that we can resist the temptation of increasing the average frame size. Even with 56 k links and 576 byte MTU, the transmission time for the frame is about 100 ms and the latency becomes unacceptable for some applications after a few hops. The extra latency due to the protocol stack overhead can be 5 to 25 ms (based on observations of TCP/IP over Ethernet) adding to the total latency.

>And we need fewer hops in order to reduce latency much more.

That would be nice to be able to route the data differently by service class.

Unfortunately, using current equipment (and in some countries regulatory constraints) the _per_user_ available data rate is very limited. We are talking about 1 line (50-200 character) per user transactions (not even a screen full of text) so the applications have to be designed with that constraint in mind. The DX cluster network is a fine example of such distributed network application. Some form of IRC implementation might be an other application that would fit into this transport mechanism.

It doesn't happen with Kantronics TNCs running in Host Mode with KaWin and
there's no good reason for it to happen with any other program either. If
the program and the connecting cable support hardware handshaking, no
Kantronics TNC is going to lose data that way. You can run your new Kpc3+
at 19.2kbps with KaWin and never lose a bit. 73,

Sorry, I missed the original post.

Most CW lasers are modulated via the power supply to the laser. This results in lots of distortion because the laser does not normally respond linearly. With diode type lasers, you can OOK modulate them with the power supply, but it takes a while for the laser to respond and ramp up power, causing problems at higher frequencies, resulting in inaccuracies and high BER, unless you design circuits to handle these cases.

The best OOK type modulation I have found is to use an A0 modulator with a CW laser. The A0 modulator blocks or unblocks the beam within a few nanoseconds. These were used on the older HENE based laser printers, and worked very well. I grabbed one out of an old printer, and used it to pass data at 100mbs (bits). They are great. You could pass data much much faster too. I used a basic PIN diode detector.

You might want to look around for an old A0 modulator from an old printer. Be sure to get the controller for it. Mine requires 24 VDC for power, and TTL for the OOK.

Good luck, and have fun.

DO YOU WANT TO MAKE MONEY FAST!?!?!?!?

The other day, I recieved this email. Now, I am a college student, and I am not at all weathly. So, I decided to give this a whirl... Good luck to you:)

"A little while back, I was reading my junk E-Mail just like you are no, and came across an E-Mail similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So, I thought, 'Yeah, right, this must be a scam!, like most of us, but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names listed in the article. You then place your own name and addresses in the bottom of the list at #5 and send an E-Mail to at least 200 news groups. (There are thousands). No catch, that was it. So, after thinking about it, and talking to a few people first, I thought about trying it. I figured what have I got to lose except 5 stamps and $5.00, right? Like most of us, I was a little skeptical and a little worried about the legal aspects of it all. So, I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Then, I invested the measly $5.00... Well, GUESS WHAT! With in 7 days, I started getting money in the mail. I was shocked! I still figured it would end soon, and didn't give it another thought. But, the money just continued coming in. In my first week, I made about $20-$30. By the end of the second week, I had made a total of over $1,000! In the third week, I had over $10,000 and it's still growing! This is now my fourth week, and I have made a total of just over $42,000!!!! And it's still coming in!!! It's certainly worth $5.00 and 5 stamps. I spent more that that on the lottery! Let me tell you how this works and most importantly, WHY IT WORKS. Also, make sure you print a copy of this article now, so you can get the info you need off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper: "PLEASE PUT ME ON YOUR MAILING LIST" Now get 5 $1.00 bills and place ONE inside of EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL! Mail the 5 envelopes to the following addresses:

1. Donald Foulk
216 N. Myers

Bryan, OH 43506

2. Scott Hilterbran
222 W. Pleasant St.
Hillsboro, OH 45133

3. Paul Mewes
5550 Fillmore St.
Merrillville, IN 46410

4. Scott Brkovich
2251 Sandhurst Dr.
Castle Rock, CO 80104

5. Anne E. Ryan
421 E. 32nd St.
Hibbing, MN 55746

Continue to STEP 2.

STEP 2: Now take the number 1 name off of the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...), and add YOUR name and address as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newssgroups. (I think there are close to 18,000) All you need is 200, but remember, the more you post, the more money you make! Don't know HOW to post in the news groups? Well, do exactly the following:

FOR NETSCAPE USERS:

1) Click on any news group, like normal. Then click on 'To News', which is in the top left corner of the news group page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!

3) Now go to the message part of the box and retype this letter exactly as it is here, with the exception of your few changes. (Remember to add your name to number 5 and move the rest up)

4) When you're done typing in the WHOLE letter, click on 'FILE' above the send button. Then 'SAVE AS' DO NOT SEND YOUR ARTICLE UNTIL YOU SAVE IT!!!!!!!!! (So you don't have to retype this 200+ times!!:)

5) Now that you have saved the letter, go ahead and send your first cope! (Click the 'SEND' button in the top left corner)

6) This is where you post all 200! Ok, go to ANY news group article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now, click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'.

Click on attach file, then find your letter wherever you saved it. Click once on your file the click 'OPEN' then click 'OK'. If you did this right, you should see your filename in the 'ATTACHMENT BOX' and it will be shaded. NOW POST AWAY!!!!!

IF YOU ARE USING INTERNET EXPLORER:

It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then, print the article for your records to have the names of those you will be sending $1.00 to.

NEXT: Go to the news groups and press 'POST AN ARTICLE', type in your flashy subject and click the large window below. Press 'CTRL' and 'V', and the article will appear in the message window.

BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES!!! Now, re-highlight the article and re-copy it so you have the changes.... Then, all you have to do for each news group is 'CTRL' and 'V' and press 'POST'. It's that easy! THAT'S IT! All you have to do is jump to different news groups and post away. After you get the hang of it, it will take about 30 seconds for each news group! REMEMBER, THE MORE NEWS GROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200!!!!!!!!!!!

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you can invent a name to us, as long as the postman will deliver it.

JUST MAKE SURE ALL OF THE ADDRESSES ARE CORRECT!!!!!!!!!

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So, then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4, and only 5 people respond to each of the orginal 5. That is another $25.00 for me, now those 25 each make 200 minimum posts with my name at #3, and only 5 replies each, I will bring in an additional $626!! Ok, now here is the fun part. Each of those 625 people post a MINIMUM 200 letters with my name at #1, and they each only receive 5 replies, that just make me $3,125!!! With an original investment of only $5.00!!! AMAZING!! And as I said, 5 responses is actually VERY LOW! Average is probable 20-30 letters! So, let's put those figures at just 15 respones per person. Here is what you will make: At #5: $15, at #4: $225, at #3: $3,375, at #2: $50,625, at #1: $759,375!!!!!!
When your name is no longer on the list, you just take the latest posting in the news groups, and send out another $5.00 to names on the list, putting you at #5. And start posting! The thing to remember is, do you realize that thousands of people over the world are joining the internet and reading these articles everyday, JUST LIKE YOU ARE NOW! So can you afford $5.00 and see if it really works? I think so... People

have said, 'What if the plan is played out and happening when there are tons of new honest users and new honest people who are joining the internet and news groups everyday and are willing to give it a try?' Estimates are at 20,000-50,000 new users every day, with thousands of those joining the actual internet. Remember, play FAIRLY AND HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW also. Try to keep a list of everyone that sends you money, and always keep an eye on the news groups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY!!! You don't need to cheat the basic idea to make the money! GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of EXTRA CASH.
BY THE WAY: If you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that, and he only made about $150 and that's after 7 or 8 weeks! Then he sent the 5 $1.00 bills, people added them to their lists, and in 4-5 weeks, he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time! You also may want to buy mailing and e-mail lists for future dollars. PLEASE REMEMBER TO DECLARE YOUR EXTRA INCOME!!!!!!"

RIght, Steve ... Charlie's posts absolutely exude what one would be
the "Oh shit!" verbalization of that queasy feeling that a deer must feel
in those last, fatal seconds in the glare of the 18-wheeler's headlights.
He knows he's toast and there isn't a damed thing he can do about
it ...

Charlie whines and insults those with better ideas and plans for
providing the services to the LAN/MAN users that his backward
dumb-terminal-login/BBS paradigm can NEVER supply. He is
full of sour grapes and nothing more ... a toad who should be
summarily ignored.

There's a file at ucsd:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming/modem.zip

That may be of use. What this does is change your dialup to
use a non-modem. With this you can put your TNC in transparent
mode and PPP/SLIP over to a neighbor.

Win95 doesn't allow two dialups however. Need to get the NT Server
for that.

Source record: 29549

I acquired a TAPR TNC-2 today that needs a bit of refurbishment.
Would like to find a source of "manual" and schematic as well as
firmware (user).

I think it would be fun to actually use this "classic" on the air
for PacketCluster or whatever...

Also need a new rear panel for the case.

Can anybody help?

For your information, your messages have propagated here to the other side of the world in a few hours. There is no need to post multiple copies of the same message (some with different subject line) in a hope of even one of them would propagate around the world. The news feed are usually quite reliable, so one message is sufficient to reach all interested persons all over the world.

Thank you for your attention.

I don't know if you're getting (got) senile, but the basis of your argument is that someone "bypassed" your radio network. In case you missed it the 20 times it was said before, there was nothing to bypass. Nothing existed to bypass.

Your endless postings about the demons who steal radio networks is laughable. There is no demon. There is no radio network.

Now, let's get serious. What do you propose to do that will "bypass" the internet? How are you going to fund this dream of yours? Who are the people who want to follow? Is there more than one? Is your only support in the backwater shanty-towns?

It's completely ridicules, your argument, and it is not even good engineering. How would a system of nodes that you propose to "bypass" the internet with, be able to compete with the long-haul wireline network? How would it compare as far as disaster preparedness? Where are the investors?

Show us your engineering proposal, and we will debate that. Show us barking, and we will bark back.

Good luck,
Steve

Of course there is. Hams have tons of money. Getting them to part
with it is a different story, of course.

>Fact: There is no way that hams can *organise themselves* to build and
> manage a universal all-radio packet network.

Now here you have the crux of the matter. So, do we all just give up
and go to the Internet?

>Fact: The Internet is here. It works, hams can afford it, and hams like
> it, for ham-related reasons and non-ham-related reasons.

So who needs radios, right? Right.

>Fact: The best way forward is to integrate radio with the Internet.

But if you have low priced, (nearly) universal access to the Internet,
why mess with ham packet? I'm serious, here. And don't give me any
of that emergency crap, please. That's even less likely than the
aforementioned universal all-radio network.

>If this means that some people want to stick with 300 baud and Victorian
>BBSs with beautifully carved polished legs, then so be it. But they
>shouldn't stand in the way of others who want to experiment with new

>at 19.2kbps with KaWin and never lose a bit. 73,

I would guess that KaWin, since it uses host mode, enquires of the TNC
the input buffer space available before it sends any data - i.e. it does
not rely on the handshaking. I'm only guessing at that, but certainly
the Kantronics host mode programming notes recommend you do that. If you
have detailed knowledge of the KaWin code, then obviously you can
comment on it.

Programs which support a wide range of TNCs in *terminal* mode, i.e. not
just one specific brand of TNC in *host* mode, will normally rely
entirely on the hardware handshaking of the TNC, which is what WinPack
does (the originator of this thread said he was using WinPack).

I can only comment on my own findings, which may of course be entirely
wrong, but tend to be supported by comments from others - With both a
KPC3 and a KAM in transparent terminal mode, when using a PC fitted with
a 16550 UART and the TX FIFOs enabled, Win95, a link speed between the
PC and the TNC faster than 2400, and software which uses the Windows API
comms services (i.e. a fairly typical Windows setup), if the input

buffer of the TNC becomes full then the hardware handshaking stops
further data being sent, but typically two characters are dropped.

If you have also carried out tests with a KPC3 in transparent terminal
mode, using a setup as detailed above, and you have found that
characters are definitely not dropped, then I would be interested to
discuss it in more detail.

PHOTO PHOENIX INTERNATIONAL

We are an international New York based agency representing
amateur and professional photographers in the following areas: Galleries,
Business and Organizations, Book Publishers, Paper Products, Consumer
Publication, Newspapers & Newsletters Publication, Special Interest Publication,
and Trade Publication.
We are seeking photographers who strive for excellence in the aesthetic/
creative and technological world of images, who have the talent to capture
the setting and to convey the mood. Your work should reflect a genuine,
pervasive interest in photography as a fine art.
Whether your work portrays conservative, experimental, stylish, or innovative
themes, your project proposal should be well thought out before submitting to
us.
For first contact, please submit a query letter, direct mail flier/brochure,
tearsheets, slides, photographs & SASE.
For amateur photographers, send sample photos and/or slides.
TO ALL: Do not send entire portfolio unless we ask for it. If we are not interested,
you might not hear from us, so please submit material that does not need to be
returned.

Send to:
Photo Phoenix International

Well, as far as I know, there has never been a long haul amateur packet
radio network covering an area bigger than a part of a state. But I'd be
interested in talking about trying to build one. What you BBSers are doing
isn't a packet switched network, and I have absolutely no interest in
discussing that.

Well, if we could assess $20 a head from every US amateur, we'd have our capital equipment money. But we'd still need money for site rental and other recurring costs, including the cost of communicating with, and collecting from, all those amateurs. I should also note that the capital equipment expenditure isn't the largest budget item GRAPES has had in the last ten years. It takes more than hardware to maintain an organziation and a network.

And we can't use as a measure how much Dxers spend *on their own stations*, or how much any other interest in amateur radio spends *on their own stations*, to figure how much we can expect to be able to squeeze out of them to fund *someone else's station*, and that's what the net sites are of course. Networking is unique in amateur radio in absolutely having to be a widespread *cooperative* activity. Even repeater groups don't expect to have to fund repeaters two states over, but a national packet WAN would require just that many times over.

A better measure would be how much Dxers have contributed to funding Dxpeditions. And that's lots less than needed. You're right that it is a political problem at heart, but it is IMHO an insurmountable political problem. We can get packeteers to cooperate enough in a local area to support LANs and MANs, but supporting a national WAN is a different matter. AMSAT is our best example of an organization drawing national (and international) support for a cooperative project. And they have been very hard pressed to attract the support needed to fund satellites costing *one tenth* what a *minimum* national WAN would cost.

>>We *do* that. GRAPES *is* our state networking association. But there's a practical limit
>>to how much we can bleed out of our users. More importantly, there's a limit to how much

>
>No it isn't. It's politically impossible, but that's a different
>argument than saying we don't have the money, technology, bandwidth,
>or manpower to do it.

Well, it is politically impossible *too*, but money, technology, bandwidth, and manpower also set strong limits on what we can accomplish. For example, the $12 million figure above would be a mighty *thin* and fragile network indeed with only single strand 56k trunks interconnecting MANs. Latencies at any real distance would be killer, and we'd quickly suffer congestive collapse just as the old 145.01 MHz backbones did.

We might be able to build such a thin WAN with an all out effort. But if we want to supply a *real* national network, capable of supporting on an inter-LAN basis the kinds of applications we are now becoming able to support intra-LAN, we'd need the kind of budget AT&T, MCI, Sprint, etc has, IE *billions* of dollars. That's obviously beyond our reach.

And while we probably could develop and adapt wireless technologies to handle the volume, we'd be hard pressed to find the bandwidth to carry it without going to site spacings which would balloon our recurring site costs out of reason, IE the upper microwave bands, requiring sites to be within each other's LOS radio horizon. That would be a typical spacing of less than 30 miles between sites in any direction. For a national grid, that works out to a huge number of sites. And that would also need switching, routing, and management systems well beyond our capabilities to fund, operate, and maintain.

And there's another factor. To maintain acceptable latency, we want every node to be no more than about 8 hops from any other node in the network. Less if we can manage it. Now the big boys do that via *bypass trunks*, IE the network uses a redundant connection scheme where sites distant in the network topology from each other have direct links rather than having to step through all the intervening links of the network.

For example, from Atlanta to LA they don't pump data hoppity hop through every Podunk node in between. They have direct trunks which bypass all that. The network routing and management system has to be intelligent enough to find least cost (in terms of hops) routes for every pair of stations in the network. That's a *very* complex job. For example, it might be cheaper, IE less latency, to route packets intended for Tempe via LA rather than hoppity hop through Podunk from Atlanta. Shortest distance isn't always (in fact seldom is) the lowest cost route. And that can change packet by packet. One packet might go via LA and the next via Dallas depending on the dynamic network loading of the moment.

But manpower is our biggest problem. There are fewer amateurs in the US than there are employees of AT&T, MCI, and Sprint. And those amateurs have their own full time jobs, so they can't give much time to the network, even if every one of them were technically competent to do so. And the reality is that there is only a tiny subset of

amateurs who are both competent and willing to install and maintain a national WAN.

What all this means is that if we pushed every limit (well beyond reason), we'd still not have the WAN we can get for $19.95 a month from the wireline providers. That's reality. Now that doesn't mean we should just scrap packet radio and all get on the telephone as Charles and Hank claim. We can *beat* the local loop using *amateur radio* methods. That's within our grasp. We can do high perfomance LANs and MANs. We can beat 33.6 kb dialup. But we can't hope to play at the national level except in very limited ways if we don't make use of the wireline networks for interties between our wireless MANs.

Now we probably could do a very *thin* WAN strictly on amateur radio if we tried. (Note I'm talking about a *real packet switched WAN*, not what the BBS message forwarders are doing, which isn't really packet radio at all. It is just BBSing which happens to use radio modems instead of telephone modems.) Such a thin WAN couldn't meet most of our national inter-MAN needs, which are expanding rapidly as we improve our LANs and MANs, but it could meet some.

It would be interesting to do (in fact I've been doing HF experiments along those lines because I find it interesting), and it could provide a useful limited alternative routing to
bypass the wirelines in emergencies or when they're suffering congestive loading due to non-amateur traffic along some routes. I think that's worth pursuing, but our priority for now should be our LANs and MANs. Efforts spent there can give us the most bang for our amateur radio packet networking buck.

Note that as expected, every amateur will go their own way. No one can dictate what packet radio and packet networks are going to look like (TAPR can't, and neither can Charles or Hank). Each amateur will do what he thinks is useful or interesting. I've expounded many times on what I think our packet networks should, and very possibly will, look like if we want to take maximum advantage of packet technology to deliver services to packet radio users. It's the direction I've been working toward for a long time now, and it is the direction I'll support others in working toward. People with different visions are free to work in different directions, of course, but unless they convince me that their vision is more interesting and more useful than the one I'm following, I won't change course.

I have always felt that 9600 was a waste of effort and $$$... Much
faster speeds and more bandwidth has been available for nearly the same
investment.

I guess more what I was getting at is at what point would, say, a 56K
WAN become swamped by the LAN traffic... But, as you point out, that
would depend more upon how much inter-LAN traffic there would be.

>>From what I have been able to gather from the Slovenian project, they

This is true... Maybe we should make a midnight raid on all the packet gear manufacturers so US Hams will have to build their own gear? :)

I have seen in recent months, perhaps up to a year, a rapid drop in prices for surplus high-UHF/low-SHF test gear. I guess that the commercial sector is starting to replace their older stuff finally.

I would think that 33cm and higher would offer some distinct advantages for a WAN frequency, perhaps also for a LAN/MAN frequency as well... Just look at the little Part 15 radio modems and such.

The problem that I see that may kill off the HTTP is actually the use of HTML to create Ham Web Pages (sorry, but that's the best name I can come up with!). We have all seen pages on the Internet that are several hundreds of K in total size. Some take many, many minutes to load with a 56K LL modem.

We have also all seen some Hams with 30+ line packet message sig files.

How long would it take to transfer the sort of pages over radio that these Hams would create? :)

Just drop into Internet mIRC (or one of the other chat servers) and look
around. Even systems like ICQ and the various Internet Phones have HUGE
followings.

Personally, they bore me to tears in most cases, but there is something
there that attracts people....

Sure, on the Internet we have "cybersex" and the trading of "warez"
that, hopefully, would not happen on packet, but even in the chat rooms
where this doesn't go on, there are big crowds.

This is more of what I think of as a "Traditional Network"... The
ability to share resources and information between all machines and
users. But, I see one big potential problem...

This is indeed doable, once we get over the radio latency problems, but
what about the copyright issue?

For example, if I have, say, Lotus 123 on my machine on the network. For
another person on the network to use Lotus to build a speadsheet, I
would need a license to do so. I suspect this is not a cheap item to
buy!

> such
>applications are possible, and prompt us to do likewise in the amateur world.

You are correct... If we can just get people to move!

I suspect that many are wondering why I am focused on the radio WAN
concept here instead of what seems to be the movement of radio LANs
connected by wireline WANs. It is a matter of both geography and
economy...

The area I am in has large expanses where the is NO Internet service at
all available. There also are no high speed phone services (ISDN etc)
available. In fact, two areas that I know of right now have only 4 party
telephone lines available. (didn't know those were still around, eh?)

By means of an example, Reynolds County MO has a population of less than
10,000 people. (there are 50-odd Hams) They also, sadly, have the
highest unemployment rate in the state. There is now no Internet service
and no one plans to offer such anytime in the future.

So, that leaves radio to provide the WAN services. Not really a bad
thing, by the way.

Granted, there are problems with bandwidth and throughput, but that is
the price we will have to pay.

Take Care & 73

Hank apparently thinks otherwise, but that is IMHO a mistaken impression
on his part in that *nothing exists which meets reasonable, current needs
in any way, shape, or form*. That's the key ... "meets reasonable, current
needs" ... and that clearly does NOT exist ... except perhaps in Hank's and
Charlie's fantasies ...

> Your endless postings about the demons who steal radio networks is laughable.
> There is no demon. There is no radio network.

This is true ... the conglomeration of dumb-terminal-login BBSs is not really
a network, except perhaps in the sense that something as backward as the
NTS could be considered a "network" ... but no datacomm professional today
would take the ""BBS network" seriously for an instant ...

> Now, let's get serious. What do you propose to do that will "bypass" the
internet?

Hank and Charlie apparently think "it's there already" ... perhaps they are
indeed satisfied with dumb-terminal-logins and 1970s BBS interface paradigms,
but most folks have had a taste of the WWW and other more modern paradigms
and the old "how you gonna keep 'em down on the farm" syndrome has set in
bigtime ...

> How are you going to fund this dream of yours? Who are the people who want

> compete with the long-haul wireline network? How would it compare as far as
> disaster preparedness? Where are the investors?
>
> Show us your engineering proposal, and we will debate that. Show us barking,
and
> we will bark back.

The problem, as I see it, is that Hank and Charlie fail to grasp the idea that
it's OK to connect the ampr.org domain to the (rest of) the global internet.
ampr.org was ALWAYS intended to be a connected, vital part of the global
internet ... anything else (like operating in some artificially-enforced
isolation)
would be an abomination .... but that seems to be *exactly* what Hank and
Charlie insist "must be" ... they claim that any connection between the
domains that allows traffic to be handled better or more efficiently (or at
all,
in some cases where no alternative routes exist) is "bad" or "evil" or "sinful"
and relegates those who provide the connection (or use it) to condemnation
by Hank and Charlie as "LandLine Lids."

Ridiculous ... Hank and Charlie need to put aside their egos and wake up
and stop trying to condemn our packet network to dark ages obsolescense
... even if that means that Hank's BBS software becomes recognized as
the (*albeit "once mighty"*) dinosaur that it has become as evolution has
taken place in the real world.

Shutting you out from distupting a TAPR mailing list is NOT an inapproptiate
action ... you act like a jerk and deserve what you get.

Perhaps if you stop acting like an idiot, you'll become more acceptable
again with time ...

> They have managed
> this feat by reducing the number of amateur radio linkages while they added
> telephone links they can control. The more hams they shut down and replace
> with telephone links, the better their ability to play "thought police"
> with the amateur packet radio community.

This is so absurd as to not merit discussion, Charlie ...

> If you have not seen my bulletins on packet lately, think about how
> wonderful it will be when YOU are censored for not agreeing with this
> clique of "Internet Forwarders". I've been posting bulletins, but hear no
> replies or comments.

Have you considered the possibility that you're such an idiot that
nobody really wants to encourage you to spew more garbage by
responding???

> This will last precisely as long as it takes to get my
> HF rig out of the shop. I'll be damned if I'll let a group of LIDs censor
> me or anyone else in the north Texas area. Radio is freedom, folks.
> Remember that.

So now you're going to splatter your garbage all over HF with
"Radio Free Charlie" ??? How quaint ...

[snipped Charlie's ridiculous anti-internet "manifesto"]

> There is no rational excuse for "Internet Forwarding". It damages the BBS
> network,

You HAVE no truly useful network, you idiot ... your "answer" is NO
answer because it is incapable of providing the level of service that
the LANs and MANs require ... it is backward, outdated, and deserves
to find its evolutionary fate ...

> We should go ahead and sic the LAW on them. That's my advice. New regs.

Typical response of a desparate used-to-be monopoly ... when "the competition" gets too good and you start to "lose market share" you try to find some way to get the government to come to your rescue and prop up the corpse ... sounds a LOT like the Luddites who insist on forcing 1847 Morse "technology" on 1990's people ... in a word STUPID.

Go away, toad ... nobody wants to have to filter your garbage out of the stream ...

I vote for a "thin-coax/BNC" ethernet interface ... better shielded
against RFI/EMI than twisted pairs ...

And the idea of an ethernet interface rather than a PCMCIA card is
good ... that will work "one-to-one" or "many-to-one" ... making the
56kb modem merely another device on the local ethernet is a great
idea ... I would favor using ethernet as a standard interface to all new
high-speed RF modems.

Crap. Hams have enough money to put up a whole series of satellites,
and you're telling me that they can't finance a basic terrestrial
packet system? Hell, there's enough ham money right here in this
little valley in the outback of Idaho to finance a far better network
than we have here now. The problem is not monetary, it's political.

>usable speeds. I admire what GRAPES has done concentrating on MAN/LAN while

Heh. Define "usable speed." 1200 baud is usable. 28.8 is not
usable. It all depends on what you're doing, and what your
expectations are.

How much money, total, do you think is spent on DXing and Contesting
every year? Throw in EME, just for fun. I have no idea, but I bet
it's more than $12 mil. How much gets spent on JUST 2 meters,
including repeaters? I don't see money as the problem, I see
collecting and administering that money as the problem.

>We *do* that. GRAPES *is* our state networking association. But there's a practical limit

> Oh, I see. I had no idea that TAPR owned and operated the BBS network.
> Silly me. I thought TAPR was still an R&D outfit. When did it become the
> operating company for the amateur network?

Gary's got a good point. There was a time when TAPR was considered to be the "bleeding edge" of amateur packet radio technology, but in recent years it has moved away from the "amateur radio" paradigm and is moving forward into something altogether different.

Don't be foolish enough to look to TAPR for leadership in an area TAPR's "leaders" have absolutely no interest in, or knowlege of. TAPR may have been devoted to building the amateur packet radio network in the past, but this is no longer the case.

If you want a national amateur packet radio organization, I suggest you start one.

Yes, of course it does. And it uses every other opportunity the Kantronics TNCs provide to extract the best possible performance from the digital modes - and that certainly includes using the Kantronics Host Mode. To do any less would be to short change the user. Also, to ignore such a powerful tool as the Kantronics Host Mode and talk Terminal Mode between two computers (and every Kantronics TNC is a very real computer) is just silly, as the results amply demonstrate.

use the FLEXNET. it's german digipeatersoftware with full tcp/ip
support.
search for flexnet with any kind of searchmachine, you will find it !

flexnet contains a full digipeater and use the internal win95 tcp/ip
sockets.

>But I still think just getting on and rag chrewing would be better.

Jerry,

You say that you tried to connect and that it didn't work. HOW didn't it work? Did you get a "connection refused" message, or just nothing? If the former, it means that you did connect to the other station but they will not allow your connection, a normal situation for stations doing mail handling to only a select group. If the later situation, it means that you don't have something working correctly...could be your audio, your rf signal, or many other things, including band conditions.

HF packet is extremely slow because packet was not designed for the hf environment. In my opinion, only computers have the patience for hf packet. Even novice cw is much faster. You may fall asleep between words appearing on your screen.

Other digital modes (amtor, pactor, rtty) are much more effective on hf. Packet is primarily used because it fits into the bbs forwarding network.

>antennae connections seem like a good idea.

Mobile dual-band FM radio's have inadequate transmitters for 9600 baud,
even when the manufacturer says they are "9k6 ready". Your uplink
performance will always be marginal.

For 9k6 pacsat operation, you also have to check it has reasonably small
steps (preferably 1 KHz, 2.5 KHz will be acceptable, 5 KHz will be marginal,
anything above will be useless), and that it be computer-controllable
(CAT, CI-V etc).

Yaesu used to include CAT even on their mobile equipment, I don't know if
they still do. I have used an FT-712RH as a receiver. It worked
reasonably well with a steerable 2x15 el crossed yagi and a preamp. The
2m version FT-212RH was completely unsuitable as a transmitter.

Roger,

I found that if you configure your YAPP as a TNC1 instead of TNC2 the
YAPP transfer will function normally. I don't know why YAPP requires
the TNC1 configuration with Kantronics TNCs, but it works.

I think you're confusing two different types of software product and two
issues here.

As regards the products - I'm sure KaWin is great with Kantronics TNCs.
Using host mode it will obviously make the most of the features specific
to Ka TNCs and all the different digital modes available in the TNC.

WinPack is highly mail/BBS oriented, It possesses a whole collection of
mail oriented features which I don't think you have got in KaWin. It's a
different product for a different type of use. It is specifically a
packet program, I wouldn't recommend anyone to use it for other digital
modes, and it is designed to work with a wide range of TNCs. You don't
have to get a different version if you change your brand of TNC and it
works fine with TNCs that don't have a host mode available. So it works
with AEA TNCs, Kantronics TNCs, PacComm TNCs, TNC2 clones, etc - and to
do that it has to use terminal mode, it's not a case of "short changing"
the user. I might just as well say that KaWin is "short changing" the
user because it doesn't offer some of the features of WinPack.

As regards the issues - *IF* there is a problem in some situations with
hardware handshaking with a particular type of TNC when used in terminal
mode, then to say it is "silly" to use it in terminal mode because it
has an excellent host mode available is not really the answer. If you
bought a car which had a faulty tyre, would you be satisfied if the
salesman said "But Sir, look how good the other three are!"

Why searching? Flexnet is available from the official homepage (plus the
documentation you propably need):

http://www.home.pages.de/~flexnet which currently points to
http://www.afthd.th-darmstadt.de/~flexnet

Any other source is not official!

Flexnet is by far the best solution if you want to do TCP/IP and use the
usual tools that come with Windows 95. Another valuable advantage of
using Flexnet together with TCP/IP is that you can still do normal AX25
i.e. in a DOS window the same time you do TCP/IP.

Does anyone have experience with programming cell phones. I have some questions. Thanks, Dave

>:-).

Yeah, but our LAN speed is 56 kb. Performance in reading bulletins is
similar to what you get with ISDN. It's fast to just page through them
looking for something of interest. The problem with looking at just
headers is topic drift. We suffer from that here on usenet all the time,
and so do our packet networks. So, if you have the LAN speed, the
best way to deal with that is to just skim all the bulletins.

>>Locally, we were kicking around the idea of incorporating a minimal router and

I prefer thinnet wiring. RG-58 is shielded and we're used to using it.
I can't imagine a case where an individual dwelling would require thicknet.

>coordination works properly (although there might be problems due to
>tropospheric lift).

The really big problem is that bit repeaters can't do packet switching.
This gives you a static topology. That's Ok on the LAN level, what other
topology could you have? But building that out to a larger network, you
find it isn't very useful.

>I admit that due to the extra cost for full duplex operation (extra
>antennas for crossband or duplexers for single band duplex) it does
>not much sense to use only 9600 bps, when the extra cost for 56k/64k
>is marginal, compared to the total cost of the station.

Yes, it's silly to go to all of that expense for just 9600 baud.

>>It seems to me that we need to attack this problem from two directions.

>unacceptable for some applications after a few hops. The extra latency
>due to the protocol stack overhead can be 5 to 25 ms (based on
>observations of TCP/IP over Ethernet) adding to the total latency.

Every added hop halves the effective speed with respect to latency. That's
the problem. Because the store and forward node has to receive the entire
frame, take a few mS to check and route it, and then transmit the entire frame
again, latency is slightly more than doubled by each hop. Even when you start
with 56 kb, you very quickly find your latency approaching a 1200 baud link, or
worse, as the hop count rises.

As Karn has noted, data can procede down a chain of store and forward
relays in lockstep, so your throughput can still be half of 56 kb even with
hundreds of store and forward hops, but latency becomes extreme. If your
activity doesn't require interactivity, and you keep the pipe full, this gives you
a good bulk data transport. But it is lousy for highly interactve use.

>>And we need fewer hops in order to reduce latency much more.

The flag is in the standard. All we have to do is write routers which obey it.
(Only software, heh, heh.)

Think of it in terms of asymmetric connections. When web browsing,
we send a few mouse clicks upstream, and take in volumes of data
downstream. If we use low latency HF for the mouse clicks, and the
bulk 56 kb pipeline for the downstream, we get the sort of match between
network performance and application performance we want. I see HF as
useful primarily as a low latency back channel for the primary data pipes.
It might even be competitive with the wireline services in that regard, given
the congestive bottlenecks they face from time to time.

Doesn't matter. I expect most hams would do what I do when I come across
one of these web pages from hell. I abort the transfer and browse elsewhere.
It doesn't take too much of that before the hapless webpage publisher learns
that no one is reading his priceless wisdom and revises his page.

If we stick to the BBS paradigm, we have to suffer through the complete download
before we can do something else. So the web paradigm is actually better for us.

It's the same thing that attracts hams to a repeater, the ability to yack with a group of people. But hams *have* the repeaters, so they don't need the chat rooms on packet. In other words, most internet users have no alternative to the chat room, but amateurs do.

[distributed networking talk snipped]

That's a thorny issue. Single site licensed commercial software accessable over the net may have to be a no-no. But I expect that many applications will be written which are designed to be used in the distributed network, so such issues will have been addressed up front, IE there will be no such thing as a single site license for software intended to be used in a distributed fashion over the net.

This stuff is so silly it is funny.
Do these folks know how to read?

Maybe it is a good thing they are no longer part of the ham radio
network, and confine themselves to the wirelines ...

Nothing they post makes any sense.

Steve,

There is perfectly good radio network between Oregon and Washington.
That is the network which was (note past tense) bypassed.

> Your endless postings about the demons who steal radio networks is laughable.
> There is no demon. There is no radio network.

Huh? Why lie? Or do you mean "There is no radio network IN SEATTLE."
??

> Now, let's get serious. What do you propose to do that will "bypass" the internet?
> How are you going to fund this dream of yours? Who are the people who want to

Huh? Why would we want to "compete" with AT&T, Sprint, etc. ?
Have you totally lost it?

> Show us your engineering proposal, and we will debate that. Show us barking, and
> we will bark back.

Huh? There is no "proposal", there is a working ham radio network!

> Good luck,
> Steve

Getting a bit paniced are you?

Afraid to answer the questions I posed, or just plain ignorant
to the point you really CANNOT tell the difference between a
wireline connection and a radio connection?

No, it is not a "packet switched network."

It is an application that USES various forms of networking
(packet switched or otherwise.)

But you knew that already Gary.

My interest is in the applications which USE the networks you
networking folks build.

But from this discussion, I understand now that I should give
up, because there will never be any better network than we now have.

Was done working on "BBS store and forward applications" more than
eight years ago and have worked on other types of applications since
then. However the network we have in place now will not support most
of those applications, since they require long haul low latency or
local high bandwidth. We have neither.

Those applications work just fine over wirelines (yes, Steve, glad
to call the teleco connections "wirelines" if that makes you happy).
They even work just fine over the local ethernet in my house. They
don't work over 9600 baud network, and until faster off the shelf
plug and play gear is available, we won't have faster radio networks.

Suspect there are quite a few of us out here doing the same kinds of
applications I'm doing ... distributed web based applications. Give
me some fast network, and I'll show you some demonstrations. Of course
you can always see them over the internet ("wirelines" Steve ...) if
you want.

Let me see if I understand this: they put a radio in the building where
the ISP is located. Thus they can claim that it is "all radio". Yup.

And they should refuse to use ham radio networks to communicate
with "the rest of the HAMS in the world" but rather force all
such communication to go via "wirelines". That's what they do.

> > Who's wires are they?

Steve claimed it was "all ham radio".
I'm still curious which hams own those wires ...

Yes, we all understand that it makes perfect sense to use these
applications
over ham radio, and that the ham radio network be connected to the
internet.
Heck, I run all those applications OVER HAM RADIO myself. It's no big
deal.

Does it make sense to use the "wirelines" IN PLACE OF EXISTING RADIO
NETWORK?

That has been my entire point.

The "Land Line Lids" and "Internet Forwarders" refuse to address this.

Gary,

When you wrote "you" up there, you meant "we", right?
It's about ham radio, right?
You are a ham, right?
You want to build ham radio networks, right?
So "you" are either part of the solution ... or part of the problem.

Gary,

I do not understand you use of "evolution" here. I was talking
about folks who abandon ham radio. It makes no sense to consider
the two things to be "the same" in any sense. Commercial wired
networks are not ham radio.

> At one time I had high hopes for the HF forwarding network. But it has

They are turning AWAY from ham radio. That is the whole point.
Lazy wimps who will not put up the effort and/or money to create
viable radio networks. But that has not been my point at all.
Let 'em do whatever they want over those "wireline networks".
But have them keep out of the way of those hams who DO want to
build radio networks, and ARE working to do so.

I know that the hierarchical approach (as in traditional telephone
systems or IBM SNA networking) is not very popular these days, but in
it, the static topology is not a big problem. All inter-LAN traffic in
a metropolitan area goes through the MAN hub and all inter-MAN traffic
goes via fixed links via a centrally located WAN hub. If the fixed
(multihop) link latency time is small compared to the frame
transmission time (eg. bit regeneration), the latency time between
users on different MANs is not much greater than the latency for users
within the same MAN. Even if the signal travels a longer distance
measured in kilometers compared to direct, but traditional links that
go directly between MAN hubs, the total latency time would still be
less.

The problem is of course that we have single points of failure, but
this could partially be compensated with some duplications at the most
critical points and some existing, but lower capacity links.

While this might not be practical today, we should try to discuss
different options that might exist.

Disagree. I often have a message session, a file transfer session,
a chat session and possibly other session open all at the same time.

No different than what I do with any other network applications.

Most, if not all, current BBS codes allow the same thing.
The only difference is the transport mechanism that gets the bytes

from place A to place B.

I'll raise my "other" issue again, in this context: what can we do
to make the "two systems" interoperable? It seems to me it would make
sense to have news transfer and email transfer between the two schemes.

Console type login (e.g. telnet or it's equivalent) and file transfers
are already available, as are database interfaces, multi-user
multi-server
chats. What seems to be missing is the mechanism to bring the store
and forward data across from one flavor of system to another.

I've played in "both worlds" for a very long time now, and have seen
enough (and written enough) applications in both worlds to understand
that there is NO real difference. By "both worlds" above I mean tcp/ip,
AX.25, DECNET, UDLC, SNA, various character based sync and async
networks.

All of the above transport mechanisms can (and do) support applications
which are multi-windowed, multi-threaded (or whatever you choose to call
it when one user does several things at the same time.) The only
"magic"
about tcp/ip is that there currently exist a large number of very well
written applications which assume tcp/ip transport ... or at least
assume
an application to transport API which "looks like a socket".

So why don't we make our (existing) tcp/ip network and our (existing) AX.25 based network and our (existing) TOR/CLOVER networks interoperate, at least for those applications which are store and forward?

A simple matter of address and name resolution should solve the hard part of the problem, the rest is a SMOP (Small Matter Of Programming.)

Anyone willing to propose a solution? I've proposed one ... and gotten essentially zero feedback. Will probably implement that proposal as is unless the ensuing discussion (if any) shows a better way.

Where have you been, my friend? I've been writing messages offline
ever since I got into packet and BBSs nearly ten years ago. There's
software now that lets you do it far better, and you can automate your
BBS connects completely. Writing and editing "on-line" is a pain in
the butt, and is wasteful of time and bandwidth, even when using
UseNet. I MUCH prefer to doing my posting here in Agent, off-line,
than to have to deal with posting via, say, Deja News. This argument
is a non-starter.

>patient. Why do this when I have the possibility of a multiwindow editor
>with complex functions already available? And still more, as I said,

That's a matter of software, not a matter of the BBS paradigm.

>http serving from my own home is still interesting to me, and BBSs will
>never allow this. Right now I have to depend on my Commercial telephone,

Sure they will. You can do it right now, on a limited basis, if
you're willing to take the time to mess with it. I don't know why
you'd want to, exactly, but it's certainly possible, at least locally.
If you mean you can't connect locally and do HTTP across the country
somewhere, then you're right. But without using the Internet, that's
not likely to be possible in the near future, anyway. And once you're
using the Internet, why would you need or want ham radio?

>Commercial phone modem, and Commercial internet provider. I am working
>towards making this available over the radio in my area. I'm not waiting

Why?

>for BBS's single stream method of information conveyance and unrealiable
>mail transport methods to kill packet. When my project is completed in

So you're going to try to help kill it by using the Internet? Nice of
you to verify what some have been saying here all along.

That's about the silliest statement I've read here today. Of course,
it's still early.

I have been following this thread with great interest and found some of the comments most enlightening with talks of LANS, WANS and MANS but surely if we could find a way to run 9600 that at least would be a help. I produce a TNC (PCB) at 1200 baud mainly the TAPR2 but with the AM7910 world modem chip. I have been looking for a long time for a suitable device to use at 9600 baud. I have only been able to find the fax modem chips which because of their training period would be useless for packet radio. Does anyone know of a suitable device or would be willing to collaborate with me in producing a cheap 9600 baud modem? Which at least would be an improvement.

> Nothing they post makes any sense.

No, Hank ... I am afraid that nothing you and Charlie are ranting
about makes much sense ... you rant about how TAPR et all
are "destroying the amateur packet network" ... but there *IS*
NO amateur packet network that is capable of filling the need
that those hated internet links are fullfilling ... at least not with
the speed, capacity, and availability that the LANs demand ...

I am sorry that you are feeling "displaced" ... but the dumb-terminal-login
and BBS paradigm is passe and you haven't kept up with the richness
of applications and services that are available with a *real* network ...
to insist on trying to "poison the well" just because people have more
"thirst" than you can satisfy is petty and mean-spirited ...

I expected more from you ... apparently I had the wrong impression
WRT you ... you apparently prefer to try to stagnate the world at
your level that to permit progress that does not include you as the
center of attention ... grow up!

> it done. Or will you give up also, and just use those "wirelines"?
>

Hank,

I have no problem with connecting amateur packet LANs and MANs
and even WANs to *the rest of* the global internet ... which happens
to be substantially wired (or microwave or fiber optic, depending on
what stretch you're traversing), commercial network backbones ...
where it makes sense operationally, or where it fills a need for connectivity
that otherwise doesn't exist (or where the available bandwidth is so
grossly inadequate that it might as well NOT exist ...)

There is NOTHING wrong with this ... it is simply sound engineering
and economic judgement ... ampr.org was ALWAYS intended to be
a well-connected part of the global internet, not some orphaned step-
child stranded and starving in the wilderness in isolation ...

However, you and Charlie seem intent on forcing that fate on ampr.org ...
and it is becoming increasingly apparent to many of us that your only
motivation is to try to foce adherence to the dumb-termina-login/BBS
paradigm that is your "claim to fame" in hopes of keeping yourself in
the spotlight ...

If you want to be in the spotlight, try doing something productive for a
change ... instead of playing the dog-in-the-manger spoiled child trying
to get attention ... your paradigm is out of step with the world ... either
embrace something more modern and useful or accept your fate ...
stop being like the die-hard Morse bigots who insist on trying to keep
everyone else stuck in the past because that's where *they* want to be.

Nonetheless, this confines one to dedicated HAM software on too high of
a level, again. Simply implementing a TCPIP protocol over the radio
would eliminate this need.

> There is nothing magic about POP, SMTP, NNTP. They are just standards

> accessible
> than those of the Internet standards.

Yep, standards that work over TCPIP, and are supported in tons of
free/shareware applications available in abundance over the internet and
can work anywhere in the world over a simple internet connection. There
is hardly any competition to speak of in AX25 networking, and in a
capitalist system, that promotes stagnation, which is occuring. Even
though you speak of point and click software for AX25, can you say it is

advanced as, say, the editor included with freely available Communicator 4.0?

None of the protocols you speak of are forms of a BBS, either, except in some sense of store and forward. They are transport protocols, designed to reliably get mail to where its suppose to go. Not much like a BBS in the way they perform their job on autopilot, without any user involvement, except to first send a message or to tell a program to initiate downloading of mail. Look at it this way . . . say I send a message from NC over the BBS net. Every station it goes through has to have its operator hand forward every bit of mail that passes, the whole message having to travel many points before its arrival, taking who knows how long (definitely unpredictable). Now, set up the same network using TCPIP and the above, very standard protocols. The message is sent, scanned for indecency by some computer program at the first SMTP site, and then, wham, ping-pong-ping-pong, quite automatically and quite a bit faster, the message arrives at a pop server, perhaps three node hops from my own house, then I call to the POP server to send it, ping-pong, right to my house, that short span alone via BBS could have took several days. How could you even continue to argue for BBSs? They burn computer time, air time (in that so much useable airtime is not used, which could be very valuable to say a telecom company that wants that airspace), consume volunteer hours and give to few people too much power.

>the growth of amateur radio linkages within the network.

Well so much for comming into the discussion with an open mind.
You're so far left wing you'll never see the benefits of anything
comming from the right.

So what if a portion of the Hams out there wish to integrate phone
lines into ham radio. It's not the panacea which will solve all of
the worlds problems but give them a go. So does this mean that people
with interests in both Radio and internet have no place on this earth
becasue YOU have no interest in it ? Proven to retard things,
BULLSHIT. Its people like W0RLI that I thought once had a genuine
interest in progressing AR, yet all I see is his brilliant mind
comming up with BULLSHIT servers that spew out SHIT messages to: LLIDS

What a waste of grey matter ! He's provided so much and now he's
become spitefull and uses his programming ability to intimidate other
HAMS into conforming to his ideas. Well listen, I can write in visual
basic and code servers for Winpack that will mail bomb other people,
it doesn't take a lot of intelligence to do this !

>If you want to participate in amateur packet radio, you damn well better
>learn to think of someone besides yourself, and show a little common
>decency to your fellow hams. If you're not up that that, take a hike. Just
>like that.

Excatly FELLA. If you want to participate, listen to others. There
are good arguements for using amprnet and good reasons against it but
until there is some regulation that bans amprnet, its bloody legal and
learn to live with it.

>
>I have no patience with idiots who care more about TCP/IP than they do
>about amateur radio and their fellow hams. If you had any decency or native
>intelligence about you, I wouldn't have to be mentioning these things. But
>you seemingly missed out on both of those items.

Well personal attacks will get you far. So what if I think ax25 sucks
? Tough for me. Yes, TCP/IP is inefficient on AR as it sits ontop of

another protocol, but SO STINKING WHAT !! People rave about ROSE or Flexnet, big bloody deal. If you like using TCP/IP and understand it, bloody use it. Why do we have to conform to what YOU want to use ?

If you're SO pissed off about the existance of Amprnet, petition your Amateur body in the US. Stop taking the PISS out of other hams that are doing NOTHING illegal !

>
>You don't need the amateur packet radio network to play your "amateur
>telephone" games, and amateur radio most assuredly does not need you. Buzz

Ywan, I'm thrilled
>
>There are at least two problems here: it's too hard and the rewards
>are too few.

Too hard. Yes, this is generally what people say when they do not know the answer to a problem. Rubbish what you find too difficult! Rewards, listen fella. This is a hobby, not a commercial system. It is for us all to experiment with and to learn from, that is why its a hobby. If you want to take it above this, cut out your part of the network and live on your own. If you can't co-exist with people that have different views, bugger off !!
>

>were "plug and play" more people would at least give it a try.

AHH, lug and pray, yeah its got to be easy or we won't use it ! Why
the hell does it have to be easy. Systems like FBB with BPQ are
difficult to understand when you have little idea of how it works.
They have been around for years so there is a reasonable amount of
expertise in the field. Believe me, there are some fantastic people
out there that understand TCP/IP and are excited using it, just like
those that know FBB and BPQ inside out ! Whatever you like, go with
it !

>
>The second problem is that IP offers little advantage over AX.25 or other

>are even better applications?

Who gives a SHIT ? Look at all of the BULLSHIT messages that travel
around the FBB systems. 90% of them are a total waste and don't
bullshit me that they were injected by internet systems. The FBB
systems don't present well and dump all the messages into one area.
At least with NOS, you can run stuff like free agent and get the
messages into some sort of order. Wake up !! Better applications.
Well does this guy know what he was talking about, he could run
Pegasus mail as his mailer, WS_FTP as the file transfer agent,
Explorer 4.0 to view web pages, Free Agent as his newsgroup
reader........ Need I continue !

Well the amount of time spent writing this message, the author could
have stuck his nose into a JNOS manual and would have learned some of
the rudimentry principle involved. There are MANY hams that have
authoured their own books on this subject and have attempted to make
NOS friendler for those that are learning.

>No, Hank ... I am afraid that nothing you and Charlie are ranting
>about makes much sense ... you rant about how TAPR et all

It makes at least as much sense as your rantings. Probably more,
depending on which side of the issue you're on.

>are "destroying the amateur packet network" ... but there *IS*
>NO amateur packet network that is capable of filling the need
>that those hated internet links are fullfilling ... at least not with
>the speed, capacity, and availability that the LANs demand ...

And there never will be, unless you involve "wirelines." Once you do
that, it's not ham radio any more. This may or may not be a good
thing, but I fail to see any point in using ham radio at ALL if all
you want is the speed and efficiency of the Internet. After all, we
already HAVE the Internet, right? Why screw it up by kludging ham
radio onto it?

>I am sorry that you are feeling "displaced" ... but the dumb-terminal-login
>and BBS paradigm is passe and you haven't kept up with the richness

Crap. That old "dumb-terminal-login and BBS paradigm" is pretty much
how UseNet works right now, although in most (not all) cases it's
faster and more efficient than the ham radio or QWK versions.

>of applications and services that are available with a *real* network ...
>to insist on trying to "poison the well" just because people have more
>"thirst" than you can satisfy is petty and mean-spirited ...

The way I see it is that Hank has moved on to more interesting and
exciting things himself. Unlike others, however, he still supports
the "old" way of doing it because it's the ONLY way that works without
help from "wireline." Show Hank a working "network" along the lines
of what you keep raving about, and I bet he'll be one of the first
ones to utilize it, just as he did with Clover when it first came out.

>I expected more from you ... apparently I had the wrong impression
>WRT you ... you apparently prefer to try to stagnate the world at
>your level that to permit progress that does not include you as the
>center of attention ... grow up!

Good advice. Too bad you can't or won't take it yourself.

3201. Advances in *NOS software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-10 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.com>
Message-ID: <01bc754b$c1c2d720$317241ce@n5pvl>
Source record: 29463

We all probably remember the excitement when we first heard about NOS.
Being open to development by all interested hams, there was a great deal of
talk about the endless possibilities this would open up to us as dozens of
new, innovative applications became available to the amateur radio
community.

Part of the idea was that *NOS would slowly evolve into the ideal, as
dictated by the wishes and needs of the ham-programmers who utilized and
modified it to suit their needs. This is exactly what has happened.
What new, advanced applications were added to *NOS?
A hacked, re-hacked, and emasculated imitation of the standard functions of
the "dumb terminal" BBS paradigm, of course.. That's the only significant
changes in *NOS, throughout it's history. Amateur BBS software advanced and
developed more in it's first few years of existence than *NOS has in around
a decade. The experiment was a bust, it seems.

Following *NOS's "program evolution" it's logical conclusion, you have --
FBB for LINUX !!

I suppose after all those years of watching *NOS constantly re-aborting
it's own progress, F6FBB took pity and put *NOS out of it's misery.

It always has amused me to hear TCP/IP fanatics describing the wonderful,
mystical "FTP" and "SMTP" protocols as if that old stuff was the be-all and
end-all of network utilization, then go home to run their software which
has been inexpertly, single-mindedly developed to imitate the very systems
they love to denigrate. If it weren't for those "utterly meaningless"
packet BBS net messages they are so proud of putting into "areas", most
*NOS stations would rapidly shut down from lack of interest.

The joke, of course, is that if the standard old TCP/IP functions were so
great, they wouldn't have been forced to include packet BBS functions in
order to (attempt to) get anyone interested in using amateur TCP/IP and
*NOS. ;-)

Would there be any interest in a topic based forum (using a Matt W. script) discussing high-speed packet? I run about 10 forums so it wouldn't be any big deal at all for me to run this one. I have plenty of servers and space avaible.

The reason I suggest doing such is: (1) There is usenet groups but they are clogged down with spam (2) very little online information exists currently (3) easy matience and content sorting

Please send me e-mail with ideas or thoughs...

Completely wrong conclusion. Since PC/FlexNet has a relatively easy
to install TCP/IP package for Windoze 95, general TCP/IP usage
boosted in central europe, rendered IP address coordinators cursing :-),
and every major BBS software now also features an HTTP/HTML access
to its data. Even hardcore commandline bbs addicts are now turning
to web browsers and graphical interfaces...

Source record: 29469

There is an informal group of amateur radio operators that use Macintosh computers called "Macnet" with > 800 members world-wide.

We stay in touch with each other via packet & Internet and we have a HyperCard stack that tells the story of each of us called "Macnet Roster" that list

o CALL SIGN @ HOME PBBS
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

Macnet members can then communicate with one another directly or use our Macnet Moderated Mailing List to pose comments or questions to all of us on the Net.

To join Macnet, put YOUR INFO (via EMAIL or via disk using TEACH TEXT on a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER").

Or connect to our home page via the WWW http://www.mv.com/ipusers/wd1v

-------<sent to all new Macnet Subscribers & Macnet Roster Updates>---------

Welcome to Macnet!

A trip to my home page also reveals there are many superb files and programs for amateur radio operators that want to use Mac computers. See more details in January 1997 QST, page 100. http://www.mv.com/ipusers/wd1v/

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Email Reflector - send an Email to all Macnet users on the Internet.

* Macnet Roster - a virtual "Who's Who" HyperCard stack with > 800 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future. See what neat things are being done with Macs and Ham Radio!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get your new programs with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lots of links to great Mac FTP sites for radio, electronic engineering, and similar data.

3208. Baycom Modem Driver For WinPack/BPQ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-10 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <tpqo0CAnQUnzEwKF@peaksys.demon.co.uk>
Source record: 29470

For anyone interested in running WinPack with BPQ and a Baycom type
modem, I have uploaded a driver package to my web site (see sig).

Have fun!

3209. NET_Mac2.3.63.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-10 00:00:00 UTC
From: adam@iag.tno.NL
Message-ID: <199706101207.OAA08569@iag.tno.nl>
Source record: 29471

The Netherlands, June 10, 1997.
Hello dear reader,

NET/Mac v2.3.63 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Fixes for longer Macintosh names
- 'smtp timer' now gives more info about the timerstatus

- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

The latest version of NET/Mac can be downloaded from my homepage:
http://www.caiw.nl/~adam

This version obsoletes all versions of info-mac/comm/inet/conn/radio-net-mac
in the Sumex-Aim.stanford.edu (and it's mirror-) archives.

It also replaces /pub/mac/_communicatie/_internet/radio_net_mac_23xx.hqx
on ftp.idg.nl.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory c:/public/mac.

Adam PA2AGA e-mail: a.vangaalen@nitg.tno.nl for mail to my office
or: adam@caiw.nl for private or hamradio mail

s play too.
> And it deals with the home user's local LAN as well.

Gary, this sounds quite a bit like the project we've started on here in
the Puget
Sound area. We have the good fortune of having the services of someone
who's already
done 56k work and is ready to move on to something faster so we've
started to cooperate
on a scaled up system.

So far our thoughts on an interface are similar to yours, ethernet from
the home network
with the interface directly to the modem(s) running at least 1/2 T1
(772kb). I've pretty
much decided on the Motorola 68EN302 for the interface. This gives us
an integrated

ethernet, dynamic ram controller and up to three radio ports. We're thinking along the
lines of makeing the software treat the whole system as something like an ethernet bridge.

> Note well this isn't a product announcement, just something with which =
we're doodling.

Pretty much the same as what were doing, nothing cast in concrete at this time. Maybe a
prototype later this summer.

> Is anyone interested in having something like this? What would you thin=
k if we incorporated
> a PCMCIA slot into the modem instead? That would allow you to use your =
own ethernet card

It would probably be much cheaper to use one of the integrated ethernet/processor chips
instead.

> in the modem. Or you could use a PCMCIA telephone modem as a bridge to =
a remote site's

Careful, you'll bring down the wrath of Charles and Hank by mentioning telephones :-)

> RF modem. Or would you rather have the ethernet interface integrated di=
rectly into the modem?

quiring you to buy
> another PC card, but it reduces flexibility a bit. Or are you satisfied=
to have a RS-422 link to
> a PI card in your desktop PC?

The PI card tops out at around 256kbps, if we're to think beyond 56k to higher speeds we =

need a faster alternative. Ethernet seems to us to be the logical step.

> =

> Frankly, I think mobile/portable packet is going to become the next hot=
thing at the LAN level.

Yup, one of my summer project goals is to enable mobile IP on a couple of our local LANs.

Exactly, contrary to Charles rants, IP 'the protocol' works fine even
at speeds as low
as 1200baud, it's what we do with it that demands higher performance. =

HTTP, digital voice,
video clips, etc. all push us towards improving the performance of our
radio links.

Whoop de doo!

So they managed to put a radio at a non-ham location, which has
"wireline" connection to the internet. Yup. I got it. I also
did a hop check to Steve, and checked WP. He does not appear to
be on either the AX.25 ham radio network, nor on the Seattle
tcp/ip network (that network's DNS reports "Unknown host").

So let me recap to make sure I understand. Steve has extended the
internet, over ham radio frequencies, to his house. Wow! Such a deal!

> count as a valid reason ...)

Uh ... "Because it is ham radio" ???

Same answer as in 1984 when I started all this: at that time there
were perfectly good network connections available to hams, and we
COULD have chosen to extent them via ham radio. We didn't. We chose
instead to attempt to create a global store and forward network.
That was accomplished in a few years. Now you wish to destroy it,
because it "isn't as good as wirelines". Never was. Was never
intended to be. It is (and was and was intended to be) a ham radio
network. Now would you please get out of the way and let us continue.

If that were true, it would not have been made a class-A network.
As it is now, it can only be a self-supporting network (with all linking done by amateurs), connected to the Internet at exactly one place (Brian's).

When it would have been intented to be a well-connected PART of the GLOBAL Internet, it would have been given enough network addresses to give every region or country an opportunity to connect to Internet.

So, I think it isn't true that it was intended to be well-connected. It was only intended to be somehow gatewayed.

A TNC with an AM7910? Looking for a long time for a 9600 baud device?
Where have you been?

9 or 10 years ago, G3RUH has developed an FSK 9600 baud modem which is
in use in many places. It is a discrete-component design, but some other
amateurs (DF9IC and others) have made GAL and PIC based versions that
integrate more of the modem (not all of it) in one chip. Certainly good
enough for a single-board TNC, should you want to make one.
(I would not know why, with so many already existing and the better
alternative of SCC cards widely available)

Do not confuse me with Charles.

You have done so in at least two ways:

1. I do not advocate any "dumb terminal login/BBS paradigm" and never
have done so. I happened to CREATE one, because that was the best
that could be accomplished in 1983/1984 with the gear available.

2. Have been on tcp/ip for many years. Run the DNS for 44.116, have a
web server (O'Reilley Website) online, and route ip for the folks

in Portland. Still waiting for someone to create better interfaces
between the AX.25 network and tcp/ip based applications.

And don't even claim to understand my motives. You do not.

> If you want to be in the spotlight, try doing something productive for a

What are your suggestions? Have described what I'm currently working on
in several dozen messsages here, on packet, and in the TAPR SIGs. You
have failed to comment on any of those ideas. So stop the whining and
get to work and present YOUR ideas. You have some?

This is for any techie out there that is familiar with the PK-88 TNC. I have one that essentially works fine, except it continually sends it's sign-on message. There is no power interruptions so it must be a componant. Any ideas what could be breaking down. It does it more when it has been on for a while. Thanks...

No, I meant Charles, and to whatever extent it applies, I meant you. What have
you done to establish and maintain packet switched networks to interconnect
our MANs and LANs?

> It's about ham radio, right?
> You are a ham, right?
> You want to build ham radio networks, right?
> So "you" are either part of the solution ... or part of the problem.

In a larger context, you are correct. And of course *we* (meaning GRAPES)
have been doing something. We have 56 kb trunks in place interconnecting our
56 kb (and 1200 baud legacy) LAN switches. We've also established links with
neighboring states (Alabama, Tennessee, and North Carolina). Our little corner
of the packet network *is* delivering the kind of performance we want (though
actually we still want better).

Our neighbors in Tennessee are busily extending their 56 kb packet switched
network across their state. ALANET has had their state linked via a 9600 baud
packet switched network for some time. I'd like to see them upgrade that, but have

to give them credit for what they've done, since they beat us to achieving a coherent statewide packet switched network.

I'm not as sure what's happening in the Carolinas. Our major sore spot is south Georgia. We haven't been able to properly serve that area due to the small number of hams on the ground down there, and the broad area over which they're scattered. That's cut us off from direct high speed links into Florida. We have to route through ALANET for that, and the performance hit that causes means we really don't have network connectivity in that direction.

Note please that I'm talking about packet switched networking here, and not just a group of hams running BBS applications forwarding mail and news by some sort of radio linkage. That isn't packet radio networking. That's just a message distribution system no different in principle from the dialup uucp forwarding done in the early days before there was a viable
internet. Of course there's nothing wrong with running applications over a packet switched network. That's what the network is *for* after all. But to consider the BBSs to *be* the network
is the tail wagging the dog.

We haven't abandoned ham radio. What we've given up hope of achieving
for now is a national and international level switched packet network. On
more local levels, we have achieved viable packet switched networks, and
we're using them. To tie those disjoint amateur radio networks together,
however, we've been forced to resort to the wireline providers for wormhole
service. Those of you purporting to provide WAN services at that level
haven't done so.

>> At one time I had high hopes for the HF forwarding network. But it has

Any progress to report? Seriously, can you list the LANs or MANs you've
been able to support with packet switched radio WAN service? I know that
we have been able to do that on a state level, but I've seen absolutely no
evidence that national or international level packet radio networks have

even been attempted. Certainly those operating HF haven't done *anything*
in that regard. Skipnet isn't a packet switched radio network. It is just a bunch
of BBS operators running their BBS application over radios. Packet networks
are totally incidental to what they are doing.

Yes, you bet I knew that. But Charles apparently doesn't, and your earlier
comments indicated you didn't want to make the distinction either.

>My interest is in the applications which USE the networks you
>networking folks build.
>
>But from this discussion, I understand now that I should give
>up, because there will never be any better network than we now have.

Incorrect. What we've been saying is that we don't expect to see a *global packet
switched network* that's 100% amateur radio in the foreseeable future. We are
working hard to build and operate better amateur radio packet switched networks.
We've had a 56 kb network here for a while now. And the work that TAPR has started
promises even faster networks in the future. But to interconnect those networks into
a worldwide amateur internet, we need to use the wireline services to provide wormholes.

>Was done working on "BBS store and forward applications" more than
>eight years ago and have worked on other types of applications since
>then. However the network we have in place now will not support most
>of those applications, since they require long haul low latency or
>local high bandwidth. We have neither.

Well, some of us *do* have high local bandwidth, and TAPR's current
direction promises us more ways to get that. What we don't have is
even experiments toward extending that to long haul low latency networks.

HF or satellite are the only ways we can get low latencies at long distances using amateur radios. AMSAT (I'm a member) is doing its part toward providing us with a switch in the sky with P3D. That'll be neat, but it doesn't have the capacity to do the whole job. Meanwhile, the HFers are doing *nothing* toward this objective. They are all doing BBSing via radio instead. That is *not* packet networking. If someone wants to actually try to use HF for packet networking, I'll be a cheering section for them. I may even have a modulation and DSP RF modem design suitable to help the effort along. But I've seen zero interest expressed in packet networking by the current HF BBS crowd.

>Those applications work just fine over wirelines (yes, Steve, glad
>to call the teleco connections "wirelines" if that makes you happy).

Since many of those wirelines aren't owned or operated by telephone companies, and don't carry any telephone traffic, that's a wise decision. When we use wormholes to interconnect our MANs, we're using pure data networks, not telephones. And they aren't always wireline. Much of the traffic is via satellite radio links. When and if we have adequate amateur radio transponder capacity in GEO, we can switch back to purely amateur radio wormholes. But that's not likely for some time to come, if ever. The expense is just too great.

>They even work just fine over the local ethernet in my house. They
>don't work over 9600 baud network, and until faster off the shelf
>plug and play gear is available, we won't have faster radio networks.

Of course amateurs have had the option of faster equipment for 11 years now. Ok, a kit wasn't pure plug and play, but we've fixed that now with PacComm producing W&T units. And the SS work that TAPR is embarking upon promises even faster plug and play in the future.

(Note, I have some problems with SS as a packet technology. It doesn't fit well into the LAN, MAN, and WAN topologies we've been discussing. But we can develop alternate topologies to accomodate it. In other words, it doesn't work well with a hub and spoke topology unless the hub is overly complex. It is best used for pure peer to peer connections. That makes a topology with a LAN switch a complex thing.)

>Suspect there are quite a few of us out here doing the same kinds of
>applications I'm doing ... distributed web based applications. Give
>me some fast network, and I'll show you some demonstrations. Of course
>you can always see them over the internet ("wirelines" Steve ...) if
>you want.

GRAPES has shown how to provide those fast networks. We've been doing it for a long time. Why haven't you?

No, you've refused to listen. THERE IS NO EXISTING AMATEUR RADIO
GLOBAL SWITCHED PACKET NETWORK, AND THERE NEVER HAS
BEEN. That's as clear as I can put it. We can't bypass what doesn't exist.

We have islands of amateur networks, but there has been no serious attempt
to interconnect them globally since the old 145.01 days. That is largely because
we don't have the funds, manpower, or bandwidth to do so in any fashion useful
to the applications we want to run, AND WE LIKELY NEVER WILL. So we use
wireline interties to join together our amateur radio networks into a global amateur
internet. That makes our amateur radio networks much more useful and interesting.

I suppose you also complain when we interconnect to the wireline with our repeater
autopatches. Now if we use the patch to call another amateur repeater on the other
side of the continent and create a linked system, does the presence of that patch
somehow make what we're doing no longer amateur radio? Of course it doesn't. And
neither does the use of wormholes to interconnect our amateur packet networks.

You managed to drift off-topic, Tom. I was speaking of *NOS, of course. The
FlexNet/Win95 combo you mention is the realization of something I have been
advocating for quite some time. - What I've wondered is why we had no
drivers for standard TCP/IP software.

FBB for LINUX, FlexNet/Win95... I expect to see these and others finally
put *NOS out of it's misery very soon.

I'm designing a radio controlled vehicle that will be receiving RF commands in the 75-76 Mhz range. This vehicle will have a micro-controller and the transmitter will also have a microcontroller and ADC. I would like to send the commands digitally. I understand that they can be sent using FSK or PCM as well as FM/AM. What is the most effective (cost/reliability) way to transmit 1,0 's. The transmitter will need to have a 30m range. Any books, websites or other suggestions would be greatly appreciated. Many thanks,

Duane Williams

I am curious, is the Flexnet package actually connected to the 95 stack?
I am asking because I am not sure. It seemed to me to be another TCPIP
stack, and applications had to be "FlexNet aware". If someone could give
me the URL, I would greatly appreciate it.

Thanks,

You might want to checkout RF Monolithics. They have some cheap
SAW resonator based devices that work in the 902 MHz Pt 15 (unlicenced)
band.

Hi Tom;
Check the DC power jack. It may have a broken solder joint and
be causing continuous resets.

3237. PcPakratt for Windows

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-10 00:00:00 UTC
From: Doug <dougw6ty@adnc.com>
Message-ID: <339E1C45.CCF8A376@adnc.com>
Source record: 29499

Does anyone know who I can turn to regarding questions about PcPakratt
for Windows with AEA not in business anymore. I use it together with
Logwindows which is now under Timewave but I have never seen or heard of
PcPakratt being taken over by Timewave Inc. or anyone else.
Any info would be greatly appreciated.
73, Doug W6TY.

3238. !!NEW!! APRS 7.93 Available (FREE Download)

Newsgroup: rec.radio.amateur.digital.misc

NEW Automatic Position/Packet Reporting System Version 7.93 is now available at http://www.bluenet.net/ke4htm (The Western NC APRS & Amateur Radio Home Page)

APRS is the best packet program available. It allows you to do HF gateways, get weather information, do GPS mobile or track your friends. So come by and download the tune to 145.790Mhz. and Join the fun. (This is a free download!)

Nah, I plan to continue the ham radio tradition of staying high tech and a reliable source of emergency communications. When I patch my area in, I plan to allow HAMS to serve HTML from their own stations. TO the internet (wired) or to the internet (radio), you know both can coexist, its just that when you obey some of the rules for the interenet you get to connect with and access a wealth of information, maybe if tcpip proliferates on ham radio, hams will begin to setup sites that will proliferate amateur radio onto the internet. It seems to me that the people here can only think about the fact that the internet is wired, they can't seem to grasp the fact if you put up a MAN or LAN, then you have added radio. As a matter of fact, before we even have a connection to the internet, we will have our own local tcpip net. The simple fact is, there is more information available about TCPIP, more standardized software and protocols for it, and alot more organization to TCPIP than any other protocol. Don't even connect to the interenet, but just use the protocols, and you can still have the interconnectivity of your local hams, sharing info and email, web pages, etc., and data during an emergency. Say in a large city, there may be a 3 BBS hop from one guy on the damaged side of town to the Weather Service on the other side of town. That message with TCPIP running on each BBS, could be there in 1 second flat or less. Same message to be forwarded at minimum, 3 minutes, and it can only get worse from that rating.

BBSs are slow, dependent on each operator in the so called "network". BBS are not set up for the needs of the emergency community. Geez, in the two days or even two hours it takes for a message to come out of a troubled spot, leap 15 BBSs, and arrive at the destination (if at all), by that time the national guard has gotten there and set up REAL communications equipment. I don't see why you can't see this.

On to your disdain of wired interconnects for RF Lans. Fiber has always been and always will be more reliable than the BBS network. I can guarantee that in the event of a full scale nuclear war, the fiber networks in this nation will still work, regardless. Most of it is

buried, as are the switches in underground vaults. The same kind of abuse would obliterate a ham radio network, from the sheer EMP alone. On top of that is the fact the participants in a long range emergency network in something as simple as a hurricane could easily be eliminated by wind in their tower, and you have a real problem when it comes time for emergency need of your RF long range network. Also add to the fact, if a man has a antenna down, but a tree in his house where his kids bedroom used to be, and even though he may be a backbone link, where do you think he is still going to spend his time? I'd say for the sake of maintaining amateur radios honor, we should incorporate fiber for long runs anyhow as a backup, even if the long haulers even come to together and provide us with a way to get packets across on RF anyway, so that when the unfortunate occurs and we loose a link, our services don't stop. After all that was what IP and the fiber internet were constructed for, to launch nuclear weapons reliably in the event a nuclear war was to occur. Hows that for emergency backup? Notice the protocol of choice was NOT X.25. The Russian strike would have been over, and their storm troopers deployed by the time the first missles were launched via a RF linked long range X.25 BBS system, if the lauch signals had gotten there at all. Are the fiber haters implying we should risk reliability over emergency usefulness, because thats what it sure sounds like to me. Call me a landline lid if you like, but I like to be useful in a emergency when I say that I can be . . .

> >any new flames of enthusiasm found in packet.
>
> That's about the silliest statement I've read here today. Of course,
> it's still early.
>
When the time comes, all you will have to do is listen and learn. Insult me as you wish, but I'll be (net)working, and you'll be here continuing to stoke the flames burning from the vapor of a rotten mindset. I will not lower my standards of networking because of the anti fiber people here who claim that their system is the answer, when it really isn't. What would be silly is if I gave up because of your or their claims for BBS, and your holier than thou attitude that you have greeted all sides with. You should consider that comments like yours above only serve to continue or ignite flame wars.

Conflict is entertainment these days (I'll admit it, flame wars are cool as long as there is no possible right answer and the people on each side BELIEVE (not have reasoned) that they are right, and it is not blocking

any type of serious discussion), but the amateur radio digital network is subject quite a bit more serious than a long and passionate flame war, and there is reasoning behind the TCPIP group claims, if not behind the BBS store and forward groups.

Later,

>
> If that were true, it would not have been made a class-A network.

I suspect that it was done that way because that resulted in an
address block sufficiently large to support the reasonable world
ham population forseeable at the time ...

> As it is now, it can only be a self-supporting network (with all linking
> done by amateurs), connected to the Internet at exactly one place (Brian's).

I don't buy that ... there are already more connections than just at
Brian's place ...

> When it would have been intented to be a well-connected PART of the GLOBAL
> Internet, it would have been given enough network addresses to give every
> region or country an opportunity to connect to Internet.

I see no insurmountable reason that things cannot be arranged so that that is
possible ...

> So, I think it isn't true that it was intended to be well-connected. It
> was only intended to be somehow gatewayed.

Things are going to change a lot in the coming years with mobile IP
and more emphasis on mobility and accessing the net from other
than fixed locations ... we will benefit from this as well as the
commercial folks ... we might even be able to contribute to it if
people like Hank and Charlie are not successful in keeping the world
stuck in the dark ages ...

> already HAVE the Internet, right? Why screw it up by kludging ham
> radio onto it?

The point is that ampr.org was always *supposed* to be a vibrant
part of the internet ... and there are many reasons to use radio ...
such as mobility and survivability as the two most important that
come to mind immediately ...

> The way I see it is that Hank has moved on to more interesting and
> exciting things himself. Unlike others, however, he still supports
> the "old" way of doing it because it's the ONLY way that works without
> help from "wireline."

But it works so poorly as to be virtually useless ...
there is nothing inherently "wrong" with using the
internet where it makes sense from a technical point ...
the economics and technical realities of how hams
are distributed and how few of us there really are in
some areas point to the fact that a radio based solution
may not be the best way to do *everything* .. at least not
now ...

> >I expected more from you ... apparently I had the wrong impression

> Good advice. Too bad you can't or won't take it yourself.

I'm not trying to stagnate anything ... nor am I trying to force
stagnation on others ... you (Glen) simply attack anything I
say ... sometimes even when I am agreeing with something
you supported before, you turn around and attack me for the
same view ... you're just a toad, face it ...

You don't need ham radio to do any of that. The folks that use packet to do this things are basically just having fun. I figure they just found a new use for there radio's & TNC's. I enjoy using the NET for the above. I believe that the NOS system is to slow for Web pages, ftp, News groups, & E-mail. A 1200bps or even 9600bps system over the radio is to slow for anything other than one-liners like in APRS. Remeber 9600 BPS over the radio on a good day runs a true speed of 4800bps due to packet not being full duplex.

So that's my opion on the subject.

Brian,

You need to see a bit more clearly.
"Civilian" (i.e. third-party aka "non-ham") traffic was not being
discussed.

And the conclusion you reach is?

The conclusion I see people advocating in this group, and in the TAPR
SIGs,
is that we should abandon ham radio and replace it with "wirelines".

I do not agree with that conclusion.

You again fail to read what I wrote.
I said no such thing, and in fact said the opposite.
Please pay attention.

> I expected more from you ... apparently I had the wrong impression
> WRT you ... you apparently prefer to try to stagnate the world at

Carl, if you would spend the small mental effort to read what I wrote,
instead of replying to something someone else wrote, you might
understand
my position. It is clear you do not. A quick search of deja news might

be useful ... but as of now you are speaking from complete ignorance

>than those of the Internet standards.

Yes, there is something magic, they ARE standards, not for accessing BBSes,
which are by and large incredibly outmoded, but accessing SERVICES on the
Internet. If you adopt TCP/IP, you get a lot of bang for you buck, because
so much of the work of implementing robust network transport and
applications has already been done by RealSmartPeople(tm).

>In reality, setting up a packet radio station with TCP/IP is usually
>more complicated than an Internet access, even if only because the packet
>radio protocols are not supported in the operating systems distributed
>by M$.

Yes, this is probably true. If you are only used to running M$ operating
systems, operating systems like Linux or even applications like JNOS can
seem daunting. But you do gain a great deal of power for your efforts.

>You probably are talking about what you experienced five years ago.
>Today, packet radio programs are able to get a message listing,
>point-and-click on interesting subject lines, download articles that
>way, and view them in scrolling text windows.

>All that is hardly related to the communication protocol, it mostly is
>a user-interface issue. Line oriented packet programs exist, and so
>do command-line-oriented TCP/IP packages.

Ah, yes, but when you adopt TCP/IP, you don't have to WRITE your packet
programs, you can leverage off all the terrific software that is being
generated for the Internet. Let's face it, the average ham (or even the
highly motivated expert programmer ham) isn't going to write something like
Netscape Navigator or Internet Explorer. Being able to leverage such
software is a big advantage.

Well I've been using TCP/IP for years and am quite happy with all it
offers, my operating system includes AX25 in the kernel as standard, but
I use a variant of NOS by choice while others here use the standard
kernel stuff and LBBS, no prizes to Thomas Seiler for guessing what I'm
running.

Let me try this one more time.

When someone uses this connection to forward a message from Seattle
to California, what transport is used? Ham radio? No.

How is the radio connected to the internet? Via a wire.

How do mail messages get from Seattle to California? Via ham radio?

No, via "wirelines", "commercial networks", "the telephone company"
or anything else you wish to call it, but NOT via ham radio. The
ham radio links work. Do not bother to obfuscate with stupid
comments like "It's not real-time". I've never talked about any
links EXCEPT store and forward.

Now those who wish to quibble will probably tell me "No, this ISP
has FIBER to it's peering points."

My point remains true however: when a HAM RADIO message is forwarded
across these "internet" links from Seattle to California or from Seattle
to Oregon, it DOES INDEED bypass working ham radio networks. To say
otherwise is to miss the entire point I've been making.

But you knew this already, and were only trying to muddy the water.

This newsgroup is about radio (read it's name above.)
If you wish to do something other than radio you will
find other newsgroups devoted to your particular interest.

If you don't enjoy ham radio networking, then why do you bother
to post in this newsgroup?

I have access to a couple of Motorola Syntor X9000. They were in service in the 460 Mhz range.

My question will they go down to the ham bands (440mhz - 450 Mhz). Also will there do 9600 baud
packet.

Thanks in advance,

Suresh Kagoo N9GSA

3256. TRANSPARENT CONVERSE SERVER SUGESTIONS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-11 00:00:00 UTC
From: Hugo Rotterdam <flashear@euronet.nl>
Message-ID: <01bc76a9$ce4dff60$LocalHost@hugo>
Source record: 29373

Dear News readers

I'm a member of PI4CC contest club and we are struggeling with a smal "packet" networkproblem.

We are using several contest logging programs which supports serial networks, but we want a remote link with the network.

In the datastrings over the SERIAL network the programs use control caracters, which are filtered out using a TNC (ore other standalone packet modems) in CONVERSE mode.
In the TRANSPARENT mode the filtering does not exist and a point to point link can be made, we tested it and it works fine.

BUT we want to go beyond a single user remote connection.

In the remote packet network every string put in by a connected station must be send to all the other connected stations. Just like a convers server does, but with the control caracters included.
A data transparent "converse" server setup so to say.

Any tips, hints ore sugestions........

Charlie is used to using "the amateur packet network" as he refers to
the kludge of BBSs which he defends against all comers, no matter how
rational their plans for something better ... he's *used* to messages not
being delivered at all, because that's how *his* preferred system (doesn't)
function ...

However, you've probably just doomed yourself to receiving his drivel forever,
because you've admitted to him that his messages get there and (at least)
you have read them ...

That is not exactly the conclusion that the majority seems to have
reached ... the majority conclusion seems to be more like "we can't
afford or coordinate the construction of a truly global RF-based WAN,
at least at this time and with the available dollars and people, so it
makes the most sense to concentrate our efforts on the LANs and MANs
where we CAN make a lot of progress, and use the internet where it's
necessary to bridge the gaps ...

> be useful ... but as of now you are speaking from complete ignorance
> of my position.

I don't think so ... your postion is clearly that any use of anything but
ham radio is evil and valdalous ... you keep alluding to the destruction
of some mythical "global amateur network" that simply doesn't exist

and never has existed, except perhaps as a figment of your imagination.

Then, you damn everyone and anyone who attempts to do something
better than the nothing that exists now, on the basis that they're not
doing it your way ... (hint ... they don't HAVE to do it Hank's way ...
they are the ones who are doing it and they can damned well do it
THEIR way ... if you don't like the way they do it, stop bitching and
do something YOURSELF if you want it your way ...)

Until you do something yourself and offer something better to the
same users as those whom you damn you have no right to damn
them in the first place ...

Maybe not ... so what??? If ham radio is not the best way to
route the message, that's a valid reason to use the wormhole
approach ... the endpoints are both ham LANs/MANs in the
respective area, right? Or is one endpoint in a different domain
than ampr.org??? Either way, the internet wormhole could still
be the best, most sensible means of routing the traffic from
Seattle to California ...

> How is the radio connected to the internet? Via a wire.

The internet *IS* a wire, effectively ...

> How do mail messages get from Seattle to California? Via ham radio?
> No, via "wirelines", "commercial networks", "the telephone company"
> or anything else you wish to call it, but NOT via ham radio.

So what? So ham radio is not necessarily the best way to link the two
LANs ... that's what ... maybe in the future, but not now ...

> The ham radio links work.

That is an assertion that most seem to disagree with ... perhaps
your standards are much lower than those of most of us???

> Do not bother to obfuscate with stupid
> comments like "It's not real-time". I've never talked about any
> links EXCEPT store and forward.

Frankly, Hank, they are not stupid comments and *you* are the
one who attempts to obfuscate by avoiding them ...

Additionally, you don't seem to get it, but it appears that damned
few people give a shit what you think any more ... you and Charlie
have made worked so hard and so long to make yourselves so
obnoxious that you have been ostracized ... you are no longer a
part of the mainstream and you won't likely be again unless/until
you stop insisting on being so obstructionist and obnoxious ...

The point that you refuse to even acknowledge, let alone accept, is that very few others feel that there is a "working ham radio network" to *be* "bypassed."

> But you knew this already, and were only trying to muddy the water.

No, Hank, you're the one who keeps trying to muddy the water with your vague references to "the amateur packet network" which really doesn't exist (except in your imagination) ...

[snipped the remainder of Hank's irrational raving about "networks" (that don't exist) ... I've come to the conclusion that he's delusional and can't carry on an intelligent conversation, so I recommend that everyone simply ignore him until he goes away ... that's what *I* plan to do ...]

USAF Academy Falcon Gold
Mission Data and Telemetry
Description

Signal Electrical Characteristics

The downlink frequency for Health & Status and GPS data is 400.475 MHz. This is accessible by most scanners and 70cm amateur radio gear. We're using slightly modified Tekk KS-960 transmitters to modulate the digital data stream from a Kantronics KPC-9612+ node controller onto the FM carrier with about 3.5 KHz deviation. This Direct Frequency Modulation (DFM) is a Minimum Shift Keying technique that's standard with the amateur radio community to send 9600 bps data, as developed by G3RUH. If you have a scanner, use the "FM-narrow" setting (but see the caveat below). To your ear, it will sound like a rush of background noise.

Each bit of the the bit stream from the AX.25 protocol routine occupies 0.104 microseconds. But before sending to the radio, it's converted to an edge-oriented signal: a one is converted to a transistion (either 0 to 1, or 1 to 0), and a zero is converted to a no-transition. This wavetrain, in turn, is XOR-ed with a 4800 Hz square-wave. (Notice that each half wave -- a high or low pulse -- of the 4800 Hz signal corresponds to one bit time at 9600 bps.) Finally, this signal is appropriately attenuated and fed to the radio as the actual "audio". The amateur radio community 1200 bps format is the same except the last waveform is used to select either a 1200 Hz or 2200 Hz tone. For the 9600 bps data stream, there is no base-band modulation into audio 'tones'. The digital waveform itself modulates the radio.

The highest fundamental frequency is 4800 Hz (from either the clock or the data stream, whichever you prefer), but this is a 'squarish'-wave, not a sine wave. The communication channel must preserve amplitude and phase information for signals significantly above 4800 Hz to preserve the proper waveshape. Typically as much as 3 times this much -- 12 to 14 KHz. Most scanners do not have this fidelity and many amateur radio transcievers older than a few years do not have this fidelity. You can use these radios, but the methods to do this are beyond the scope of this article.

Some newer radios have special provisions made just for this fast data. Even an expensive scanner such as the AR-5000 doesn't

have an audio signal path that works (even with adjustable audio bandpass and compensation). We use the front panel connector, which provides a signal directly from the FM demodulator.

Digital Data

We use the AX.25 packet protocol, which surrounds actual data bytes with 20 bytes of extra stuff. Unlike standard RS232-ish data, this is a synchronous format, so no start or stop bit is used. One byte of data immediately follows the previous byte of data. Sometimes you'll hear this called an octet to signify this fact. Similar to serial comm popular in the PC world, within a single octet, Least Significant Bits are sent first. An AX.25 packet is described as follows (A single transmission may consist of multiple packets.):

1 octet - 7E flag byte
14 octets - to/from addresses
1 byte - Control byte
1 byte - PID byte
N bytes of data
2 bytes - CRC checksum
1 byte - 7E flag byte

Notice the 7E flag byte generates 6 consecutive 1 bits. One additional feature of AX.25 is that if the data bit stream itself at any time provides five contiguous 1 bits, the sending station inserts a zero bit after the fifth 1 bit. The receiving station, of course, strips this extra 'stuffed' 0 bit before trying to interpret the data. This ensures there won't be any 7E hex values except as the first & last bytes of a packet.

Each of the 14 address octets is shifted one bit left. All address octets have a 0 in the LSB position, except the last address octet, which has a 1.

Data Content

Falcon Gold will take 40 millisecond snapshots of the the GPS 1575.42 MHz L1 frequency. The RF signal will be downconverted and then sampled at a rate of 2 MHz. Since the C-code (course position code, not the C computing language!) is modulated onto the carrier at 1.023 MHz, FG will obtain a roughly 2x oversampled bit sequence. Remember, Nyquist theory doesn't apply here because we're not regenerating a waveform, but rather sampling individual bits. This process will yield 80,000 bits of data.

52 bytes of header information is tacked on the front of the actual data, yielding a 10052-byte sequence that needs to be downloaded to the ground station. A space-borne microcontroller will sample health and status information from the satellite, collect the 10052 bytes of mission data, and send it all to a KPC-9612+ AX.25 TNC.

The data logged by our ground station will look like that shown below. This is the data format that we can most readily use here at the Air Force Academy. If possible, please e-mail us logs of data in this format.

```

Each packet containing GPS data (#2 through #43) is exactly 246 bytes long, inlcuding the date/time stamp done by the receiving station, and the terminating CR/LF pair. The dummy-data sets shown above include embedded CR/LF characters so the '1's and '2's, etc don't roll off the right side of your screen. Use the MSTAMP and DAYSTR commands (Kantronics commands) to make your TNC do the time stamping shown above, and please ensure your time is within a half second of UTC. Ensure your TNC is not doing line wrapping for the terminal display.

The H&S packets (#1 and #44) will remain a fiixed length for the mission, but we'll be making changes right to the last moment. Shown above is the current state of affairs. The last GPS packetThe first 48 bytes of packet GPS43 are sampled GPS bits. After that, are 208 bytes of unuseable binary values.

Every four minutes, another 44 packets of information (another frame) will be downlinked by the Falcon Gold payload. Combining multiple frames into one log file is fine.

What *ever* gave you that idea, Rob? A Class A network gives us a large
name space but places no constraints on the network topology or routing.

It whizzed right over his head, Hank. Some folks just aren't equipped to participate in the fraternal aspects of amateur radio and for this reason, they cannot be trusted to respond to a call for reason or decency. The welfare of other hams cannot compete in the minds of such "hams" with base expediency. To them, "the ends justify the means", and to hell with everything and everyone else, including amateur radio. The more advanced cases are perfectly capable of cheating at solitare, then bragging when they "win".

Hence Gary's inability to comprehend or properly respond to your point.

I assume Brian is talking about an NTS message, but is so removed from the mainstream of amateur radio that the acronym escaped him.

Read carefully, Brian! :

The difference is that when Hank or anyone recieves an NTS message to deliver, whether that message arrived by CW, voice net, or packet, the message can be said to have been transported via amateur radio, because amateur radio links were the primary means of transporting that message. The fact that the use of non-ham communications for the last few miles of transport AND the transition from amateur radio to "civilian" are all accomplished within the smallest possible fraction of the total distance covered is very significant.
In the case of NTS message transport and delivery, the non-ham means of communication are kept to a bare minimum, and in all cases amateur radio is used as the primary means of transporting that data.

As in phone patches, the telephone (wireline, ect for hair-splitters) is used as an accessory to enhance an amateur radio activity. This is how amateur radio operators handle the use of non-amateur links.

In "amateur TCP/IP", you and others suggest that the "tail wag the dog".. That non-ham means of communication be used for primary transport of the data, with amateur radio tacked on as an "accessory". This is a radical departure from both the traditions and responsibilities of amateur radio.

This, and the fact that hams who DO use radios as the primary means of transport are tired of being maliciously interfered with are the main reasons that the amateur radio community is ultimately unlikely to end up endorsing or even allowing "amateur telephone", in the long run. You've managed to bury yourselves by making it plain that as a group, you care more about TCP/IP than you do about amateur radio and your fellow hams.

A very good example of this is the fact that you only see " a difference in the demarcation point.".

Get it?

I'll bet you either don't "get it", or don't care... Which is it, Brian?

Ahh, this is where I think you're incorrect. The bad press that Amprnet systems have received in OZ revolved around the "injection" of nasty messages via internet. This appeared to be ace card the Non-Amprnet sysops were using to close down the gateways. I agree the medium does not control the message, this has been my arguement precisely but yet those that want to proclaim radio as a microphone only hobby keep ramming this down our throats ! They are specifically targeting IP systems and not FBB/AX25 systems as a lot of these chaps clearly do not understand the concepts of NOS.

Ham Radio is used at the transport layer. Why are we so hung up about the actual physical mode of communication. Yes, Yes, it is amateur radio and it conjours up visions of someone thumping away on a morse key or someone yelling at the top of their lungs into a mike calling CQDX. Exactly, you do not need radio to participate, no one denys that (that I know of) but as per one of my last questions, what if there are a LARGE number of hams out there that wish to cross over the boundaries and utilise what they see the best of both worlds ? Do they have a right to exist ? Do they have a right to experiment and

furthur their own training ? Why does WS_FTP have to be exclusively used on Internet, why can't I use it on radio. It is the mindset that it was delievered to connect to other COMPUTER systems and therefore it cannot be used on Radio. You may not want to run these tools on AR but a lot of us want to ? Lots like to run BAYCOM, go right ahead. I think it is a pig of a program but others swear by it, I probably think it is a pig as I don't like baycom style modems. But remember this, I don't go jumping on people and tell them to use TNC's when they are just as happy to continue the way they are.

If the discussion was purely about the benefits/cons of running IP and stayed at a technical level, that is pretty interesting stuff. When you've got people bleating over peoples rights and being told IP is a waste of time, the issue moves away from technical reasoning to pure emotion and then some trying to enforce their views onto others, just like WORLI does with his LLIDS server. Now what a wank this is. If I wrote a server that mail bombed him with his own messages because I don't like his attitude, would that be tolerated or would I be supressing his freedom of speach ?

Do you suggest that they setup their own network and not participate in any way with the current structure. DO you think there is the money out there to duplicate the existing structure ?

We can't loose sight that AR is specifically for experimentation and self training. AR does NOT mean I have to experiment with transistors and resistors, that is not in the regulations and if you think it is, show me the clause ! I'm always prepared to learn something new...!

Then where are they?
It seems that no matter what ampr.org address I try to traceroute on the
Internet, it always finds its way to Brian's place. From there, there are
tunnels, but that can hardly be called a reasonable routing mechanism.

>> When it would have been intented to be a well-connected PART of the GLOBAL

How are you going to convince the Internet routers that 44.0.x.x is to be
routed different from 44.137.x.x ?

This has been discussed over and over and over again on tcp-group, while
I was still reading it. There were clever folks there who never gave up
explaining that names are not addresses, and addresses are not routes.

But today, we still have one large class-A net routed completely via
Brian's system. It may be possible to have it another way, but at least
it has not turned out to be practical (or else: why is it done this way??)

The final two words of your comment are what I was referring to.

>stagnation on others ... you (Glen) simply attack anything I
>say ... sometimes even when I am agreeing with something
>you supported before, you turn around and attack me for the
>same view ... you're just a toad, face it ...

Calling me a toad is an excellent way to get me to stop attacking you, I suppose? The fact is that you do your cause far more damage with your constant insults, putdowns, namecalling, and sarcastic boilerplate cliches than if you never posted at all. You scoff at Charles for his use of "Landline Lids," and yet your own rhetoric is far more annoying and redundant than his, at least in this forum.

None of this has anything to do with Radio vs. Landline.

>On to your disdain of wired interconnects for RF Lans. Fiber has always
>been and always will be more reliable than the BBS network. I can

That's not the point, is it?

>guarantee that in the event of a full scale nuclear war, the fiber

In the event of full-scale nuke war, none of this will matter one whit. Let's try to keep this on a rational level, OK?

>at all. Are the fiber haters implying we should risk reliability over >emergency usefulness, because thats what it sure sounds like to me. Call >me a landline lid if you like, but I like to be useful in a emergency >when I say that I can be . . .

I haven't seen anyone suggesting that you couldn't use whatever method you wish to communicate in an emergency.

>When the time comes, all you will have to do is listen and learn. Insult >me as you wish, but I'll be (net)working, and you'll be here continuing >to stoke the flames burning from the vapor of a rotten mindset. I will >not lower my standards of networking because of the anti fiber people >here who claim that their system is the answer, when it really isn't.

OK, you're going to go with the Internet. Fine. I like the 'net myself. But it isn't ham radio, and the more you mix the two, the less radio you will have, and the more landline you will have. The reasons for this are too obvious to have to explain them over and over again.

>What would be silly is if I gave up because of your or their claims for >BBS, and your holier than thou attitude that you have greeted all sides >with. You should consider that comments like yours above only serve to >continue or ignite flame wars.

Heh. This flame war was raging long before I jumped in, and will continue long after I'm gone. When I see you attacking folks like Carl for HIS insults and "holier than thou" attitude, then I'll give some credence to your objectivity.

>any type of serious discussion), but the amateur radio digital network >is subject quite a bit more serious than a long and passionate flame >war, and there is reasoning behind the TCPIP group claims, if not behind >the BBS store and forward groups.

Well, there goes the old objectivity.

> and others who would LOVE to have them for PCS services.
>
> Hank nf0h@cloudnet.com

Hank,

The fact that W0RLI and a few others refuse to accept is that there
are situations where it is impractical to provide a satisfactory grade
of service between LANs/MANs (the WAN part) ... in those situations
and for connectivity to the *rest* of the global internet, it is desirable
to have gateways between ampr.org and the *rest* of the global internet.

W0RLI and Charlie, principally, seem to feel that anything that connects
to anything that is not purely amateur radio, somehow taints the whole
thing and makes it "evil" and "vandalous." That is, of course, a totally
ridiculous assertion.

I haven't seen anyone saying "abandon amateur radio links" ... just
some folks who admit that there is really not adequate or practical
inter-LAN/MAN service in many, if not most, areas of the world and
have been creative enough to connect those isolated areas by using
the best means possible ... the internet ...

Carl,

Last night I checked to see if you had ever used the packet BBS
network you continue to demean. It appears you have not. Perhaps
if you wish to comment about it, you might first discover what it
is, what it can do, and how it does those things.

It was rather surprising to discover that many, if not most, of
the folks who post in this newsgroup have, in fact, never used
the packet BBS network. Simple to check, and surprising results.

Helps to clarify the amount of mis-information posted to this group.

CU on the radio network Carl <smile>

>>> Part 2 of 2...

no> reader..... Need I continue !

If one is creative, you can run _anything_ that is utilised on the Internet. Afterall, TCP/IP is TCP/IP, and applications don't care (in fact shouldn't know) what physical medium they're being used over. As long as the bandwidth is sufficient, they'll work. As for getting those GUI apps working, you _do_ have to be creative, but hey, aren't we experimenters? (last time I looked, amateur radio was supposed to be all about experimenting)

no> Well the amount of time spent writing this message, the author could
no> have stuck his nose into a JNOS manual and would have learned some of
no> the rudimentry principle involved. There are MANY hams that have
no> authoured their own books on this subject and have attempted to make
no> NOS friendler for those that are learning.

And there are many more operators who are willing to help a newcomer understand NOS and TCP/IP. Once I got on air, I had no problems finding people to help me set it up, and even offer suggestions as to how to optimise NOS's performance on packet. Most people were only too willing to help, whether I asked for it or not <grin>. Funny how the common interest does that. :-)

These days, I have the opportunity to play with all the current bells and whistles on high speed LANs and the Internet (and get paid for it :)), but there is still a special attraction to networking over the air for me. Even some of the Internet crowd "ooh" and "ahh" at the concept of packet radio ("What, you _don't_ need a phone line"?). Not to mention the satisfaction of getting a working AUTOEXEC.NOS (or .NET) on the air. ;)

As for wormholes, I was there when the Melbourne wormhole opened (and if I remember right, an active member of MPRG). Funny thing is that the concept looks a lot like what they call "virtual private networking" in professional circles (minus the encryption the commercial systems use). And I first saw the concept on amateur radio. Hmm, are there still some areas where amateurs are leading the way? In any case, the idea of using the Internet as a carrier for amateur traffic is hardly a waste of time IMHO, even though it's not a panacea, as you rightly point out. The commercial world obviously sees some value in the concept, as is proved by several major software vendors, including Microsoft (with NT4 Service Pack 3 and their add-on router for NT4).

... What?! No WARP? Worf, Data .. get out and push!

>>> Part 1 of 2...

It's 10 Jun 97 12:35,
We'll return to none@of.your.business and All's
discussion of What's wrong with Packet

no> So what if a portion of the Hams out there wish to integrate phone
no> lines into ham radio. It's not the panacea which will solve all of
no> the worlds problems but give them a go. So does this mean that people
no> with interests in both Radio and internet have no place on this earth
no> becasue YOU have no interest in it ? Proven to retard things,

I agree. Why should we limit ourselves to one physical medium? I
would have thought it to be good practice to utilise the best medium for
a particular job. If that medium happens to be a landline Internet
link, then so be it. :-) In any case, there's nothing wrong with
experimentation, as long as one follows the regulations.

no> Excatly FELLA. If you want to participate, listen to others. There
no> are good arguements for using amprnet and good reasons against it but
no> until there is some regulation that bans amprnet, its bloody legal and
no> learn to live with it.

As for any other facet of amateur radio. I don't particularly care for
HF or contesting, so I don't participate in either. If someone else
prefers to contest on HF, then good luck to them! :-)

no> Well personal attacks will get you far. So what if I think ax25 sucks
no> ? Tough for me. Yes, TCP/IP is inefficient on AR as it sits ontop of
no> another protocol, but SO STINKING WHAT !! People rave about ROSE or

TCP/IP sits on another protocol whatever medium you're using. If you're
on an Ethernet, you're sitting on top of the Ethernet link layer. If
you're using a dialup, your IP is sitting on top of PPP or SLIP.
However, using AX.25 can be more inefficient, since the packet size is
smaller, meaning the IP headers take up more relative space in each
AX.25 I frame.

no> Flexnet, big bloody deal. If you like using TCP/IP and understand it,
no> bloody use it. Why do we have to conform to what YOU want to use ?

Exactly! I used to be very active on packet several years ago. I
started out with a TNC and a terminal program, played around with G8BPQ,
then heard about this thing called NOS, so I asked for a couple of IP
addresses and played with NOS. Funny thing is that it turned out to be
the best thing I ever did, now that the Internet is the "in thing". My

NOS experience gave me a good head start in networking (as well as being a valuable "practical exercise" at the time I was studying networking! :)).

Maybe I'll get back on when I can overcome some technical limitations (like finding a way to erect a suitable antenna when I have no space to do so).

no> If you're SO pissed off about the existance of Amprnet, petition your
no> Amateur body in the US. Stop taking the PISS out of other hams that
no> are doing NOTHING illegal !

Or better yet, live with it, and go do your own thing, like any reasonable person.

no> Too hard. Yes, this is generally what people say when they do not
no> know the answer to a problem. Rubbish what you find too difficult!
no> Rewards, listen fella. This is a hobby, not a commercial system. It
no> is for us all to experiment with and to learn from, that is why its a
no> hobby. If you want to take it above this, cut out your part of the
no> network and live on your own. If you can't co-exist with people that
no> have different views, bugger off !!

:-)

If it's too hard, do what I did. RTFM, ask a few local IP operators for pointers and experiment. Pretty soon, it becomes second nature.
Besides, these people who say it's "too hard" might actually learn something if they gave it a go (shock, horror! ;)).

no> AHH, lug and pray, yeah its got to be easy or we won't use it ! Why
no> the hell does it have to be easy. Systems like FBB with BPQ are
no> difficult to understand when you have little idea of how it works.
no> They have been around for years so there is a reasonable amount of
no> expertise in the field. Believe me, there are some fantastic people
no> out there that understand TCP/IP and are excited using it, just like
no> those that know FBB and BPQ inside out ! Whatever you like, go with
no> it !

Besides, we all started out the same way... knowing absolutely nothing about anything.

no> Who gives a SHIT ? Look at all of the BULLSHIT messages that travel
no> around the FBB systems. 90% of them are a total waste and don't
no> bullshit me that they were injected by internet systems. The FBB
no> systems don't present well and dump all the messages into one area.
no> At least with NOS, you can run stuff like free agent and get the
no> messages into some sort of order. Wake up !! Better applications.
no> Well does this guy know what he was talking about, he could run
no> Pegasus mail as his mailer, WS_FTP as the file transfer agent,
no> Explorer 4.0 to view web pages, Free Agent as his newsgroup

>>> Continued to next message...

I can't help you with the 5100, but I have followed this proceedure
to get this thing running with a parallel port. I assumed that
virtually any NPN transistor would work, so I went down to
radio shack and bought about a dozen 2N2222's for a couple of
bucks. It worked fine.

Source record: 29322

I have a schematic for an Inductance-to-voltage converter, and I noticed that it uses a CMOS NAND-gate (74hc132) as an inverter (one input tied to Vdd), to use it as an oscillator and/or amplifier. Now, does anyone know what the difference will be, if I just use a simple inverter instead? Does a NAND-gate have advantage over the Inverter on the pull-up or pull-down characteristics?

Jeremi Lee

3286. TCP/IP "Logic"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-12 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.com>
Message-ID: <01bc7724$9c19dd40$397141ce@n5pvl>
Source record: 29324

Let's see... If two guys with HT's (Hams) sent a message 1/4 mile to a flag-waver (non-ham) and then thousands of flag-wavers then undertook to semiphore that message all the way across the United States to another couple of hams with HT's so that at the end point, the message is once again being transported by ham radio means for the last two hundred yards....

The TCP/IP fanatic would then say "That message was transported across the USA by Ham Radio."

An amateur radio operator would view the process differently, of course.

And I thought this last year's debate on packet was long over...how wrong
I was. I'll spell it out for him:

AR = (WIRELESS + WIRE)coms

Anyone who dissagrees is simply not an amateur.

Paul.

3289. Packet for Emergency Communications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-12 00:00:00 UTC
From: Ron Hashiro <rhashiro@gte.net>
Message-ID: <5nnlpcdjt1@news8.gte.net>
Source record: 29387

Does anyone know of specific instances where the emergency management community (Civil Defense, Red Cross, Salvation Army, etc.) has set up and established amateur radio packet networks specificially for the purpose of passing hardcopy messages during emergencies and disasters.

I am interested in finding out:

a) Type of PC software used.
b) Type of packet network and TNCs and Radios used (1200 vs 9600 baud).
c) Frequency band used.
d) Approximate range between nodes.
e) Track record on experience and results.
f) Whether the software supports IP and Internet connections.
g) Was an Internet connection implemented.
h) Whether special firmware was needed in ROM for TNCs, such as X14J, ROSE, NETROM, etc.
We've done trials of packet systems in Hawaii in the past for such work, and will be working on a production level network in the months to come. From these trials, congestion and congestion management is an important factor, and therefore the routing of messages become important.
A single node Packetcluster system was successful in passing digital messages between Kauai and Oahu during Hurricane Iniki in Sept 1992.

However, when a station attempted to access via a two digipeater hop, the system ground to a halt due to excessive retries.
Needless to say, that station was removed from the network.

Before proceeding, we'd like to find out experiences from other locations. I look forward to other respones.

Ron Hashiro, KH6JCA
Hawaii State Civil Defense
Oahu Civil Defense

3290. SGC 2000 comments?

Newsgroup: rec.radio.amateur.digital.misc

Anyone using an SGC 2000 in a digital mode? I'm looking at one for my boat
and wondering if I can get away with one radio for both marine & digital
ham vs. two radios.....

thanks for any feedback,

dave.

>

Greeting Charles.

I need to take some additional band width of the group to yet again
correct misinformation being presented by yourself to others.

Here is the extract I wish to correct. You wrote:
"Background: Years ago, I remember being somewhat surprised to hear that
TexNet, an early high-speed packet network based in Texas, would be
utilizing fiber-optic links in order to tie together several sections of
the network and improve end-to-end "connectivity". These "wireline"
links were given a lot of press at the time (by TPRS) as being a great
step forward in amateur packet radio networking. At that time, Greg
Jones WD5IVD (now president of TAPR) was an influential figure in the
Texas Packet Radio Society, and in some measure should be honored as the
"father" of Amateur Telephone due to his early efforts with TPRS and the
TexNet "wirelines". In recent times Greg has shifted his emphasis away
from donated fiber optic links and more to the Internet, but to this day
he still continues to promote Amateur Telephone as a great step forward
in amateur radio digital networking. "

I sure wish you would do a little research before passing along
revisionist history to others, who do not know the history first hand.
Heck, as the TPRS newsletter editor, I would have thought you would have
at least read some past issues and tried to understand the history of the
organization you wish to personally attack and denigrate now even while
being our Newsletter Editor (strange).

The first wireline incorporated into TexNet happened in 1986, several
years before I was even a member of TPRS and many more before I was an
officer and finally President. This first wireline connection was
between Austin and Dallas and allowed a critical mass of operators in
each city to communicate using the same networking technology. There was
no way in 1985-86 to make this happen and it wasn't until 1991 that there
was an RF link finally possible between the two cities...because the
critical mass grew in between (I'll get to this in more depth later).
Tom McDermott, N5EG (now Pres of TPRS as of HamCom), and Tom
Aschenbrenner, WB5PUC (Tom has a new call now) creators of TexNet in 1984
were responsible for this linkage. TexNet wouldn't exist today without
the critical networking mass created by this wireline wormhole early in
the networks growth.

As to the later usage of wireline technology during my term as President of TPRS, I can take little credit for this. TPRS is actually using circuits acquired by The West Texas Connetion a voice linking repeater group (I believe they now have a new name these days and my apologies if I got it wrong in this post) and Harry, N0CCW, was the person responsible for getting TPRS access to these circuits. Having access to these circuits allowed TPRS to reach West Texas and the Panhandle area, which would be nearly impossible to raise the necessary money, equipment, and later support such amateur non-commercial networking across a part of Texas that has no critical mass and little interest to support such activity to reach a few areas with the necessary interest.

I am humbled that you would think to call me the farther of using wormhole technology in amateur radio, but many, many more hams and groups before TPRS were doing this sort of thing. So, I think, you need to hit the books and actually research and insure accuracy of information before stating them as fact and misinforming those that might read it.

As to the concept that TPRS might regain its once great stature, since I have now left. I would point out that during my term as President of TPRS, we had more RF network building happening (not because I was out single handily building RF links), but because we had connectivity to sections of the state that allowed critical masses of interested people to participate and build RF networks in the areas where they could 1) use them, 2) support them, and 3) benefit from them. In the short time I was President of TPRS, I took an organization with around 100 members to become the second largest packet radio group in the US with a little less than 600 members.

A dedicated core of individuals helping local and regional groups allowed TexNet to grow to include four states. Mileage spanned by the network trunks (backbone) is phenomenal for an amateur packet network and breaks down as follows:

UHF RF amateur radio 9600b fsk 1559 miles 53%
VHF RF amateur radio 1200b afsk 147 miles 5%
Donated carrier wire line 1253 miles 42%

Network total trunk mileage 2959 miles.

While TexNet does use wireline connections, let's keep in mind that the 42% above is less than the total RF backbone span and that much of that is the coverage to get to West Texas and the Panhandle -- a good use for wireline facilities in this instance -- or at least a pragmatic solution. You might call me a 'landline lid 'or currently father of 'amatuer telephone', but why is the network I help support and led as President have considerably more 9600 baud RF backbone then any other amateur network in the US ?

I am sorry that you think that the pragmatic use of wireline based systems to support other communities that wish to particpate in digital communications is bad -- but you are wrong on this one.

Just as a little more detail, the above mileages are point to point from site to site statute miles for active operating sites, as of the end of 1996. In the case of the donated wire line circuits, city center highway mileages were used, and the various carriers deviate from these paths considerably, making the actual circuit mileages higher by some uncalculated amount. These figures include the whole network from Alpine, Texas in the southwest, to Amarillo, Texas in the northwest, to near Aurora, Missouri in the northeast, to Little Rock, Arkansas at the far eastern point, to Victoria, Texas and Corpus Christi, Texas on the Gulf Coast, to near McAllen, Texas near the Mexican border in the far south end of the network. The network includes metropolitan coverage into three state capital cities • Austin, Texas, Little Rock, Arkansas, and Oklahoma City, Oklahoma.

All of this work because we were doing interesting things and getting networking into parts of the state(s) that would never be reached by trying to string together 4-8 nodes that could never be supported and maintained once built to remote regions of the state. Much of this was because the networkers in TPRS, which I was only one of many, worked on it and made things happen.

Let's take the Oklahoma to Texas route over the Red River. Why don't you support the necessary node that is required to replace the one that was lost last year, becuase we lost access to the site ? You can either actively particpate in building these RF networks you want, or not do anything and probably force the creation of a wireline connection in order to replace the missing node that no one really has the time to drive three hours to fix even if we still had a site. If a wireline connection is made between Oklahoma and Texas in order to replace the node that can't be supported anymore -- then you will have contirbuted to that connection. You Charles! for not particpating in the creation of such RF links.

Dave Wolf, WO5H, who replaced me as President did a fine job in maintaining the organization and worked on trying to strengthen it during a time of downsizing in many other regional groups. As of this last week, Tom McDermott, N5EG, founder of TPRS has again taken the position of President and I believe that Tom will be able to led TPRS into a next generation of networking and membership activity. Why ? Becuase he has positive plans that include people -- not ones that are crticial of them for not thinking the way he does. Amateur digital experimenters are hungry for something new. That time is now and many of the regional groups that TAPR is working with see and feel the same way. Why do you think we have such interest in Spread Spectrum ? Such interest in high-speed data systems ? Such interest in making things work for the better ?

As I mentioned above, the wireline in West Texas or Austin, never killed anything. They helped to spur growth into areas that needed communications and connectivity that would never be reached by building RF into them at the time -- or at least bankrupt those that might have tried to do it. It might be fun to build the 300 miles of 5-8 hops

between Dallas and West Texas, but who is going to maintain it and support it after you have found the money and the sites to build it ? Most of us that take a pragmatic approach to building network these days becuase since 1984 we have been there, seen that, and done what you think should be the puritian approach to amateur radio digital communications. Life is to short to take single stand positions on how amateur digital communications networking should be or will be done.

As an example, these cities in West Texas typically had a handfull of people that made it happen, but as a result hundreds could particpate in communications. What was more important -- allowing people to learn, particpate, have fun, and communicate or be worried about the link across the sparse part of Texas to them was over a wireline ?

The key point in many of your arguments regarding 'amateur telephone' come down to the simple fact -- which came first ? The chicken or the egg ?

What are pragmatic solutions to the hobby and what are just lazy solutions? What you point to as projects I have been involved with are not lazy, but pragmatic in nature. I am sorry that you have never been able to view it from that vantage point.

You can't have RF networking into a region unless there is already a significant critical mass to build, use, support, and maintain the links to and from. What you would like and what is possible and economic to build are two differnt things. Sometime the answer is getting that wireline connection into the region in order to have the growth necessary for later RF networking from the region to someplace else. I can point to just as many examples that show that wireline use has promoted growth as you can show that amateur operators just got lazy and didn't do anything. Wireline connectivity is easy to point out and say 'this is the bad guy', 'this is what is killing my perceived aspect of the hobby' --- but doesn't it really come down to the amateur radio operators in any one area you point at that has had a down turn in interest, probably not brought about by the connection, but by other factors -- typically just getting tired of doing what was fun at the start and now just boring....time to move onto something new ?

As to the argument that a wormhole keeps people from getting involved in networking that live between -- that is ludicrous. If someone in a city between two points is __really__ interested and __really__ has the determination to get connected, some solution will be found. Look at San Angelo or Alpine in West Texas. Several years after the connections were made to West Texas, a few hams in Alpine Texas wanted to get on, well the RF happened to make it possible to connect them. Working with others and not giving up they made it work. Again, I have seen a lot of people walk up and talk in large project terms about doing things, just to never hear from them again. This happens -- that is why it is a hobby and I never place blame on anyone. It wouldn't be fun unless we thought about the great things we could be doing if we only had the time, energy, and money to be doing them -- sometime real life impinges upon the hobby aspects

and this has killed a good many potential projects by a good many hams. We have to be pragmatic about what can be supported and what can be built.

Anyway -- this issue will never be about your judgement on what other amateurs do or what others think is correct. If someone decides that they want to use the Internet to connect a wormhole to someplace else --- that is there call. If they want to build all RF links someplace that is their choice. What someone decides to do in amateur radio as long as it is legal under part 97 -- that is their option and not yours. They have just as much right to do it in peace as you do your aspect of the hobby.

This is not about verbally assultating and criticizing others for what they think the hobby is about -- what this is about is expanding the tenets of the hobby as set forth in Part 97. Have you read the rules lately ?

If you are not a part of the ongoing process of change and building within your region, then the people who are doing, building, and creating will be deciding what communications you will have available to you to some large extent. This is why amateur digital communications is about linking groups of dispersed critical masses together so that they can enjoy this aspect of the hobby as a group for the whole and not isolated islands of communications with very thin route communications linking them together -- which was what we still have 15 years after the first packet radio contacts and BBS came on the air. You benefit from this now by participating in a BBS intranet that passes information back and forth. You enjoy that -- I don't insult you or call you names because you do that -- I think it is great that you have found something to be a part of and provide a service to the amateur community ---- BUT please give me the same right to follow my aspect and interest in the hobby in peace.

It is a shame that you somehow feel that you should spread misinformation and tell lies about others that have worked hard in supporting local, regional, and national efforts and projects over the last ten years. These people do it for the love of it and folks like yourslef have run a good many productive volunteers away from Part 97 and into other services. You might win in the end becuase everyone has left, but then your hobby will have lost, because these people will not be part of it and help keep the technical change required to keep amateur radio alive and well and in place in the future.

One last word -- You know, what your messages do for me Charles ??? -- they just tell me that I am doing the right thing during a paradigm shift within this aspect of the hobby and the hobby overall. I now get messages from folks that support the approaches I have outlined and the goals I and the TAPR board of directors have set. If anything, your postings on USENET and forwaded to countless BBS systems have made these normally quite voices drop me phone calls and e-mail telling me to keep it up and stay on track. Also Charles, thanks for all the messages about TAPR and myself on the Packet Radio BBS systems. We were [TAPR that is]

wondering who we could find to get more attention on what we were doing onto the BBS systems -- and you have filled that role nicely. While the posts might be a little biased, I must see a number of people joining TAPR becuase they read what you are saying and then have gone and done research on their own and discovered that they are very much interested in the same thing TAPR is doing and supporting. I would say your messages are help membership by maybe 10-15 new members a month. A BIG thanks for the support on that front. Might even have to make sure we get you a comp copy of the PSR (TAPR Packet Status Register), so that you have new stuff to write about every quarter on the evils of TAPR to keep TAPR in the bulletin flooding stream on 1200 baud packet radio terminals everywhere.

Cheers - Greg Jones, WD5IVD

3297. Re: Packet for Emergency Communications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-12 00:00:00 UTC
From: John Welton <John_Welton@unc.edu>
Message-ID: <01bc7737$ffc8fd40$d5e70298@JWELTON.UNCH.UNC.EDU>
Source record: 29395

Ron, in North Carolina, the DX Cluster has an emergency mode to pass traffic during emergencies and for Skywarn activities. The cluster meanders across the state via a 220/440 9600 baud backbone (BPQ code) with 2M 1200 baud access locally. The state EOC and I believe the NWS office have TNC's.

You may take a look at the NC Section page at:

http://www.ncarrl.org/

Best person to contact is Reed Whitten, AB4W, NC Section Manager. He will be able to give you some insight on packet use during hurricane Fran that visited us last September. I'm not sure how useful packet would have been during and after the storm, though. Locally, we were without power for 5 days and had quite a bit of downed trees throughout the Triangle (Raleigh-Durham-Chapel Hill). Most of us in the affected areas were preoccupied with basic needs - getting drinkable water/ice, finding nonspoiled food, clearing trees from roads and houses, finding places to stay when houses were too damaged to live (which was very few instances fortunately), finding chains saws/generators and building materials, etc. Most of the amateur activity in Orange County was in support of Red Cross at local shelters during the storm and assisting with damage assessment afterward. We had a station activated at the 911 center of course and I had the university hospital set up with a portable station that was not needed (fortunately). The coast (abt 75 miles away) got hit much harder with extensive flooding and coastal damage. I'm just trying to think how packet would have helped in those areas - there really wasn't much of an infrastructure left to use a packet system. An alternative might be to use Pactor on HF - slower, yes, but can be implemented with mobile/portable HF without need for a stable network.

I will say on a personal note (as an AEC) that field deployable packet has a lot of advantages over voice but a lot of disadvantages as well, especially the complexity issues of setting up field deployable packet stations. We are beginning our packet implementation for Orange County based on a DX Cluster node at University of North Carolina campus in Chapel Hill and dedicated TNC's at the county Red Cross and 911 center.

Even if we had a substantial core number of hams who could deploy packet stations in the field what kind of messages would be better passed by packet as opposed to voice? What would the value of an Internet connection be (if the Internet was even available in or around a disaster zone)?

John, N4SJW

I'll agree with that, and that is what the wire long range inteconnects
for radio LAN/MANs allow us to do. Keep a foothold on the air, because
the long range networks just aren't coming together, and we can't just
put down the radio until everything is ready, or these companies will
come in on it.

Thanks for the reply. Looks good.

The first level of traffic we're shooting for is the
mass of "hardcopy" traffic that is lengthy and detailed,
such as medical information, or requisition of supplies
and manpower, as opposed to tactical moving of supplies
or people. Tactical communications is much better done
on voice.

The "hardcopy" traffic is for various emergency
management agencies that are headquartered in office
buildings. While the buildings are not specifically
hardened against hurricanes or tsunamis, we believe that
it is important to provide the headquarters with reliable,
timely, backup wireless communications of the type that
amateur radio provides when phonelines go down and their
primary needs are better suited for hardcopy as opposed
to straight tactical voice communications.

This is precisely the type of communications that flowed
between Kauai and Oahu during Hurricane Iniki over the
single node PacketCluster. We expect a similar communications
pattern to materialize on Oahu during a direct hurricane
strike. There are many more levels of packet that
would be needed; for example, 'backbone' communications
over mountainous terrain from the more remote locations
to the metropolitan/downtown area which would have to
be addressed on a case-by-case basis based on the
availability of skilled people and equipment as well
as the situation at each remote site. Therefore, we
are not targeting these areas yet unless we know of an
opportunity where such people and equipment are
off-the-shelf and ready to go.

I must admit that during a direct hurricane hit that much
of the community would be preoccupied with matters such
as clean-up, relief and recovery, and that simplicity
would be on the order of the day. As the situation
gets closer to the field, local tactical voice communications
becomes more predominant and methods such as 2m
voice simplex are better suited than packet.
As the zone of impact widens, the more strategic
the communications becomes and the better packet/digital
becomes as a viable solution. Packet would be better
suited between various headquarters and with the

shelters...if we could get enough people
and equipment.

Based on what happened with the Iniki experience, I
would venture that field deployable packet would be
more difficult to set up on the fly than a pre-installed
and regularly tested network that is activated. Therefore,
field deployable packet should be considered as a
point-to-point communications method per frequency rather
than as a common Metropolitan LAN solution. As the
damage to the field makes conditions become more chaotic,
the odds of making packet work on-the-fly (as opposed
to restoring an existing network where digipeaters and
nodes which are also out-of-commission in remote areas),
especially by the people that live in the area and
are affected, diminishes rather rapidly. It would take
time to move in packet resources from unaffected areas,
so voice would have to carry much of the critical traffic
during the early hours(days).

(By the way, one of the strategies employed in Hawaii
to beat this problem is to use repeater and other
vantage points on a neighboring island, which has a
separate power grid. Unfortunately, most of the
phone communications is still homed back to Oahu,
so we really couldn't take full advantage of a
neighbor island's phone system for recovery.)

Today, we are after the pre-installed and regularly
tested metropolitan LAN solution for headquarters first,
backbone and local access to more rural locations second,
future growth and expansion to field deployable packet,
with the last tier to possible Internet access. The sequencing
of the last two is subject to availability of resources.
A pre-installed and regularly tested packet system
dedicated to emergency communications would
have a good chance at survival and operations.

Hope this gives you some background and insight
of our situation. Once again, thank you for
the information.

Hmmm, 4 9600 baud repeaters
1 1200 baud repeater
7 1200 baud simplex lans
1 Internet Gateway
All linked at speeds ranging from 1200 to 19200
and all running TCP/IP.

Yup, sure looks like NO network to me.

Plus local designs being developed for high speed (> 512kbps) radios.

Obviously we're only interested in killing off packet radio.

Har! Haw haw haw ... giggle ... chortle.

ROTFL

"Radio is wired communication."

This whole discussion has been a terrific giggle.
Have people really become this ignorant?
Sure is fun watching the responses ...

The license with the 1.6 package specifically states that nobody
may put the software on a publicly available server, but
that one Ham may freely give a copy to another Ham.
Since that is the case I can privately give a copy to anyone
who asks me. I will FTP it, or email (MIME) it you you,
just let me know.
I bought mine from PacComm in the US, who are one of
about 3 companies that can legally sell the software.
This is very good stuff. I've tried numerous Win/Packet
programs, but still prefer the dos based 1.6.

Interesting ..... A lot of the old boys club would like to see CW retained,
for whatever reason. (preserve the hobby and the old boys club).
Unfortunately it has been one of the limiting factors of Amateur radio,
discouraging people rather than helping the cause.

The same is happening with Packet Radio. The old boys would hate to see
it interfaced to other networks, because of trivial regulations and fears of
commercial overflow. Encouraging large amounts of third party traffic
especially on Microwave frequencies or UHF CDMA etc could really see
some of our bands getting used and hence they may not be sold by the
very people who are supposed to be protecting them.

New protocols such as ATM (TDDA) and frame relay and AX.25.L3+
along with the demand for a ""SHITLOAD"" more bandwidth in 'off the shelf'
radios/modems. Some operators prefer to work with software of AR rather than
the hardware nuts and bolts of radio.
CDMA also has a lot potential. A little bit of collective thought might
help solve some of the TCP/IP problems over radio.

From: smaynard@home.com
Message-ID: <33a43e86.131176814@news.msnv1.occa.home.com>
Source record: 29404

My HTX202 is receiving noise when hooked up with the PK88. I know it's the TNC that's generating the noise. When I turn the TNC off, the noise goes away. I'm not sure if I have these two units properly wired. There is nothing in the manual for the PK88 how to use it with this radio. I hear the Icom is supposed to be similar.

Anyone else using the HTX202 with the PK88?

I'd like to take a crack at that, John. Packet is ideally suited to logistical comms. It is good for passing lists of needed supplies, or lists of names of people in a shelter, or lists of casualties enroute to a medical facility, and the like. It can also be used to forward medical information so that there is no chance of error, and can maintain a document trail in case there are any doubts. It can also be used to access a hazmat database so that on the scene first responders can obtain information on how to handle a potentially dangerous release. And it can be used in a Skywarn sort of spotting network to concentrate reports at a central location, IE National Wx office, for evaluation. Or it can collect and concentrate damage reports for the EMA. Anywhere lists of information need to be passed, or information concentrated, quickly and with high accuracy, packet can be the best choice as transport.

The example of querying a hazmat database is a case where interoperability with the internet would be an asset. There are standalone hazmat database programs for packet, but it is often better to be able to reach a more comprehensive database. Medical situations
can also benefit from being able to interoperate with the internet to reach medical information
and advice. And of course, routine health and welfare traffic can use the internet as long range transport once packet gets the message out of the immediate disaster area.

In disaster situations, it is best if the system can automatically find and configure routes
rather than depending on fixed preset routes. TCP/IP was developed for military applications
where large parts of the network would be expected to sustain damage, yet the network must continue to function. It is designed to route on a packet by packet basis so that it can
immediately respond to failed routes, or take advantage of a new route with a lower metric, in a way that is transparent to applications using it for transport.

Unfortunately, current amateur implementations don't offer dynamic routing. Rather they depend on fixed cluster routes. That can be fixed, however. There are several routing protocols
which can be used to keep the routing tables updated. Some are sophisticated, some use simple
flooding techniques to discover and report links and their quality. (Netrom does this, but over
the slow links where it is used, the routing updates are costly, and are thus done too infrequently
to meet the dynamic needs of a mobile or disaster situation.)

This is something we should have been working on, but energies have been diverted into less productive avenues like adding BBS functionality instead. With the coming of high speed mobile
packet, we are going to be forced to address this issue of dynamic routing head on. Much of what
we've been doing with packet from fixed locations has functioned with rigid and inflexible routing
schemes, but that won't do for a highly mobile packet community. (And that's exactly the type
of community we want for emergency response.)

With the coming of higher speeds and mobility, we are going to have to make packet work as transparently as the cellular phone network does. We can do that, and without the need for the
large fixed (and vulnerable) infrastructure of cellular. That's because TCP/IP can allow us to do
peer to peer routing to form ad hoc network paths automatically on the fly (The Ricochet network
does this already in the commercial world). To make that practical, however, we need enough bandwidth so that routing updates won't clog the network as they do in the slow Netrom networks.
That speed is becoming available. Our 56 kb RF modem is one such, but the SS systems TAPR is
working on will be even better for this sort of usage.

I've been harping on this idea of dynamic self-configuring peer networks for a long time now.
Few have paid any attention. But if we are to address the needs of disaster communications, we're going to have to address these issues. It has been done at the military and commercial
levels, and we can do it at amateur levels too. We've been wanting higher packet speeds anyway, and the rest is just software <heh>.

Most of the software work has already been done by the military and commercial worlds. All we have to do is adapt it to our amateur systems. There is no reason we can't have systems as easy to use as a cellphone where we just click on the station we want to reach and our systems automatically discover and configure a route for us. At the local level, we don't have to use hierarchial methods, we don't have to depend on fixed infrastructure, though we can take advantage of that if it is available and operable. Instead we can operate
on a pure peer to peer basis via dynamic ad hoc links.

Higher speeds also open up other opportunities for emergency communications services. For example, at 56 kb interactive video conferencing starts to become practical. We can have rovers out surveying damage and relaying digital pictures back to the EMA. Or our Skywarn spotters can deliver on the spot pictures of cloud patterns back to the forecasters at National Wx. We can do these things over internet dialups today, and with faster amateur packet we can do it over radio too. We have the technology to do this, all we need is the will
to put it together and make it happen.

From: tvu@hotmail.com
Message-ID: <5npejo$s3r$1@news.nyu.edu>
Source record: 29406

I'm setting up a Linux machine with an original 8-bit Soundblaster to use Thomas Sailer's Soundmodem module, which makes the soundblaster emulate a TNC.

I'm having difficulty hooking up the SB to my Yaesu FT-5100.
My problems are:
1) Do I wire the SB to the Packet port or to the mic port of the FT-5100? (if packet port, what type of plug does one need for the radio)

2) On the Soundmodem web page, it lists schemes for wiring the PTT from a serial or parallel port to the radio. The schemes employ a BC237 or BC547 transistor. Are there more common replacements for these transistors that I could use?

thanks & 73,
T. Vu

How many of the links that Charles and Hank are defending are using spectrum suitable for PCS? Essentially none. They're talking about HF and 2m forwarding, mostly at 1200 baud or slower. The frequencies the commercial companies may want are those where we can do high performance local LANs and MANs, but where long distance trunking is impractical, IE upper UHF and microwave. To make these sorts of high performance local systems a national or international network requires linking via internet or other non-amateur means. Thus if we *don't* use the internet, we'll sharply limit the functionality and growth of high performance LANS and MANS. And that *will* leave amateur spectrum vulnerable to commercial attack.

I doubt he wants these email addresses for the purpose of boycotting.

Greg, I think you are just wasting your time responding to this crap.

To debate a radical religious extremist is never worth the time and
effort it takes. Regardless of what you say, they appear to listen but
simply can not 'hear'. They are hell-bent on the 'crusade' and will
not allow their purpose to be swayed by 'foolish' reason or rational
argument.

Desperate wild eyed extremists should be considered dangerous. As long
as THEIR cause is supported the ends will always justify the means.
The closer 'the cause' gets to its' inevitable death the more
desperate and dangerous they become. Take a look at the sheer volume
of mail and postings cranked out attacking the imaginary evil. It's
impressive but almost eerie. Think about it. Who has the time and
energy to put so much effort into battling some figment of their
imagination?

The good news is that no one is listening. (with the exception the few
'faithful'_) If no one is listening or changing their views why waste
your time and breath. Just put it in the &#65533;killfile&#65533; with the other
garbage.

Well several folks (including myself a few weeks back) mentioned mobile (in the LAN/MAN context). I am curious at to why you do not consider this a valid answer. It seems so obvious to me, that I must be missing something.

Worldwide E-Mail PRESS / INFORMATION RELEASE - Dated: 12 June 1997

From:- Leicester Radio Society (LRS), Gilroes Cottages, Off Groby Road, Leicester. England. LE3 9QJ (Callsigns - G2AA / G5UM / G3LRS / G6XRS)

John Alexander / G7GCK. Chair of Leicester Radio Society. E-mail lrs@jalex.easynet.co.uk

Subject:- Leicester Radio Society Associate Membership Discount Card

Dear Sirs,

LRS is one of the oldest radio societies in the UK (formed 1913) and now requires a move to newer premises with better facilities for training and operating - ready for the next millennium.

We have negotiated a series of discounts with hotel groups and car rental companies within the UK. Anyone who needs to hire a car or book hotel rooms within the UK could benefit from our card and make savings - up to 35% for car hire.

Companies currently with us include Avis Rent A Car Ltd, Hertz (U.K.) Ltd, EuroDollar Rent A Car, Stakis Hotels, Wayfarer Inns and Jarvis Hotels. Together, these excellent companies offer a superb range of accommodation and vehicle hire possibilities.

It is not necessary to be a licensed Radio Amateur in order to obtain a card - it is available to anyone, anywhere around the world, who may visit the UK. Some Car rental companies are also offering discounted rates within the USA and Europe.Every card purchased increases the funds available for those new premises, equipment and training.

As the cards are taken up we expect that other companies will offer discounts, broadening the range and type of savings that can be made - these will be updated onto our new web site.

The discount card has been priced at £10 (Sterling) and can be obtained using a Mastercard, Eurocard or Visa credit card. We intend that this modest cost is recovered very rapidly as bookings, and consequent savings, are made.

Our new website contains details about LRS, its members and what we are hoping to achieve. An order form for the Discount Card is included and can be printed, completed and posted to us here in the UK. Subscribers should allow 28 days for delivery.

Check out http://www.foobar.co.uk/dialin/silver/lrs The web site gives information about membership / associate membership and the benefits of joining up with us.

We are a reputable Amateur Radio Society with big ideas for the future. LRS seeks only to further Amateur Radio in general and all monies raised will be used to this end. JA

We hope that you will include this information within your publication(s) and websites and bring it to the attention of your readers.

Please direct any enquiries to me, John Alexander, via snail-mail, fax or E-mail at the above numbers / addresses. Anyone requiring hardcopy text on LRS Letterheads can be supplied with these via standard mail or fax upon request.

With regards

John Alexander / G7GCK

That is not true. I anticipate the use of mobile-IP and CIDR routing
to make the entire paradigm of single-gateway interconnection obsolete.
We're doing it that way now because we don't have much of a choice, but
the mechanisms to change that are maturing and we'll start using them.

We're already using variable-width subnetting, and shortcut routing,
and I have high hopes for being able to do CIDR routing within the
year without breaking anything that currently works. Hang on for
the ride!

And what difference does that make from allocating the 44.x.x.x block? Both
are Class A administrative domains.

I'd suspect that this is exactly right. If someone had the right relationship with their provider, there's no technical reason that a provider couldn't announce a route to some classless sub-allocation of net 44, _provided_ that the ham could prove to the ISP that said subnet was indeed allocated to them via whatever approximated a reasonable authority.

Of course, the local Internet community also requires "some small degree of Internet sophistication", and I have seen more than a few ISPs who couldn't get their own routing right, much less pop-ups/Mobile IP/etc.

Oops, sorry, didn't mean to be jaded or anything...

>and others who would LOVE to have them for PCS services.

Hockey puck.

PCS has already got its allocations. Uncle got billions of dollars
auctioning them off. Then Uncle gave everyone a gift with the new Unlicened
NII (U-NII) allocations, which btw might slightly annoy six or seven hams who
occasionally use some of those frequencies. Apple instigated U-NII.

Our amateur radio allocations, money, etc. cannot provide the long-haul
medium-bandwidth links that the public Internet can; by mixing the two, we
make the radio portions more useful.

This discussion reminds me of the old timers who kvetched against commercial
radios -- appliance operators will destroy ham radio too! Progress marches
on.

Ive been reading this thread for quite a while ,and would like to add a few comments.
I got into packet radio in about 1980 with 1200 bps and a TNC .
I got out of packet radio about 10 years later simply because of the fact that the "radio" part of packet radio wasnt going anywhere, ie after 10 years amateurs were still using 1200 bps when alternatively technology was flying past them .
Even today in 1997 the "radio" part of packet radio is still dawdling along at the sickeningy slow of 4800 bps.
I tried with zero success to get amateurs here in Canberra interested in 9600 bps back in 1985 and got basically no interest whatsoever.
Whats happened to the experimentation into the "radio" part of packet radio .Im sitting at home in my lounge room , sending this email to the net using packet radio ,(not amateur packet radio.) which is running at 256 kbits per second) and the technology is old,(5 years old.)At work I regularily use packet radio ,(not amateur packet radio) technology which runs at 2 megabits /sec.So lets simply stop abusing each other and how about start improving the "radio" part of packet radio.
After all the Amateur Radio Service is about amateur RADIO, its not the amateur communication service ,or the amateur alternative internet service.

Because the delay times between BBS message transfer is horrendous, the
delays for human processing is tremendous, and the outrageous
assumptions that long range repeating of AX25 packets make. And all that
time you are not utilizing allocated frequencies that companies would
love to obtain. Now, since obviously no one who has long range BBS
capability is going to participate in packet switching (at least those
found on this list), all that air time just sets out there being under
utilized. Wire feeding radio lans/mans allow hams to utilize air space
in a interesting manner, and occupy the airspace so that the big
coporations don't get any brilliant ideas about taking our frequency
allocations.

I'm sure you weren't over a 1200 or 9600 baud link, but a 56Kbaud link
would be quite impressive. And the slavic radios conveying 1Mbits/sec
would also be quite impressive. Not to mention the fact that there are
not many well visited Inet sites out thee that can even send data to you
at much faster than 5K/sec, unless you access it in the middle of the
night.

> WB7DOW @ KB7CFD.ID.USA.NOAM

You are hilarious. You presented no opposing reasoning in your reply, just emotion. Obviously trying to debate anything with you is a total waste of time on my behalf, as you dismiss everything as if you sat upon a pedestal above us all, knowing the answers and allowing us to figure them out on our own. Well, you obviously don't have any rational arguements, reasons, etc. for keeping TCPIP out of packet and you aren't going to listen to mine for using it, so I think its time for me to withdraw from this debate that is soon becoming flamewar.

Never again,

David L Pearce
dlpearce@eos.ncsu.edu

PS: I think this is what you, Hank, and Charles wanted anyway, was for us to give up. Well, I give up trying to explain anything to you, but not to anyone who is interested. So, may you know now, my IP over radio recruiting is far from stopping, I am just halting my waste of creative energies trying to explain anything to you and your anti-TCPIP crew.

>

This is precisely the application.....Internet for outbound long-haul
messages. In Hawaii, much of the metro Honolulu telco inter-office
transport is
going underground in large fiber rings. The inter-office transport
also links large commercial sites, which could include governmental
and commercial buildings. If a packet gateway could tap into
Internet service via the fiber rings, it stands a high probability of

surviving a hurricane strike. (We'd just lose all our residential
and small business telephones and faxes and cellular sites, that's all.)
That solves the local loop transport.

There's also two fiber cable landings at opposite ends of Oahu, so the
probability that the raw transmissions connectivity with the mainland
is high that it will stay intact. However, as mentioned, we'd probably
lose phone service while maintaining Internet service to the largest
of commercial/governmental sites over fractional T1 links. Once again,
a packet-to-Internet gateway is an ideal way of handing off
long-haul traffic back to the mainland automatically. And, if
you've ever had to handle the traffic by hand for the many hours
that the hams did during Iniki, you'ld appreciate this small
point immensely. The fiber rings between the LEC and the cable
landings are hardended in concrete capped conduits.
That solves the LEC and IXC transport.

So, all we really need is the feeder from the amateur radio operators
in the field/headquarters, and the system is set (on paper).

We have the reverse inbound traffic situation also solved for
implementation
at the right time. So, it is meaningful to pursue the above scenario
provided other factors and objectives have been met.

There is value in combining the relative strengths of amateur radio
and commercial communications technology for a high availability,
backup emergency communications systems.....

>part.

Well maybe that's the case in the US but let me tell you, the world
does not revolve around the US ! In VKLand it was the pettyness and
absolute low down tricks inflicted on HAMS by a small number of HF
stations that almost cripled the network around VK. There were NOT
many routes available and if you got on the wrong side of someone, you
were cut off from the rest of the world.

>
>The "Internet Forwarders" have now introduced widespread censorship to the

>fit them like an old comfortable shoe.

If that's the case, I bet it is the "OLD BOY SCHOOL" running HF that
is manipulating the Internet forwarding paths. Listen to this bloke
WHINGE.

>
>If you have not seen my bulletins on packet lately, think about how

>wonderful it will be when YOU are censored for not agreeing with this
>clique of "Internet Forwarders".

Ha ha. yes, I remember not agreeing with the HF forwarding stations
and I was ridiculed and put on the reject list !!!

>
>Internet Forwarders....
>
>They destroy radio links and offer hams the telephone instead...
They bypass antiquated 300baud HF links to ensure HAMS can
communicated reliably 24 hours per day. It gives those stations with
only VHF/UHF connectivity the chance to experience worldwide
communication without having to errect a 100FT tower and pump out 1
meggawatt !

>They introduce organized, widespread censorship to amateur packet radio.
Paranoia rules. This is what's been happening over the last 10 years
on HF and VHF and people are plain sick and tired of it !

>They denigrate the BBS net, but insist on being "part" of it.
One point of view but there are many others !

>They are QUITTERS who have given up on Radio.
They have broader views that understand a much larger picture. They
are not quitters, they are sick and tired of "pissing on the wind" so
they are taking their intelligence to an area where they can use it!

>They rationalize vandalism as an act of progress.
I don't see anything broken, don't vandals actually physically break
things ?

>They do not play well with others.
get off your soap box. The HF big boys don't like to have their style
cramped. Just like those DX pileups where onl;y the BIG BOYS are
allowed to play. Unless you're an OLD FARTyou're not invited !

>They show no respect for their fellow hams. (If those hams "do" something
>different.)
What is going on here, I'm confused. This guy won't respect
individuals ideas so where is this guy comming from ?

>They are parasites upon real networks such as Packet or the Internet.
Its the parasites that want to control the network, the OLD BOYS that
have been the masters for the last 10 years and they don't like to
come off second best. Live with new technology lads, you'll learn
something !
Look, I just can't go any furthur with this as the arguements this
gent uses can be applied 100% to the current RF network. It has its
share of vandals and policemen, who's he trying to fool.

Look at WORLI, he actually wrote a FBB server to INSULT stations that
forward via wormholes. Makes you want to write a Winpack server that

would flame him from every point of the globe. Maybe we won't as it takes quite a "child" to write something like that, that just insults people......

All flames welcome !!!!

It amazes me how many of the very strongest "Radioless Ham Radio" advocates
appear to have jobs with related industries. On more than one occasion, I
wondered if certain individuals were looking forward to a "pat on the back"
from their employers, after managing to talk amateur radio operators into
cutting their own throats.

>would eliminate this need.

You may have missed the point that some amateurs actually like to write
programs to use in their hobby. Several packet radio programs and a whole
line of derivatives of TCP/IP packages have been written by radio amateurs,
just for the fun of it.
When you only talk about eliminating the need for writing software, the
next step (or the step before?) is eliminating the need to build radio
equipment, to get a license, etc. You can just get Billies software and
go on the Internet.

>> There is nothing magic about POP, SMTP, NNTP. They are just standards
>>
>> for accessing a BBS, and similar standards have been developed by

>is hardly any competition to speak of in AX25 networking, and in a
>capitalist system, that promotes stagnation, which is occuring. Even
>though you speak of point and click software for AX25, can you say it is
>advanced as, say, the editor included with freely available Communicator
>4.0?

Most of the amateur packet software is more advanced than the Internet
stuff in terms of amount of data sent to accomplish something (=efficiency).
And the situation with freely available Internet software is getting worse
all the time. In the beginning, a click on an item in a WWW browser resulted
in a request that could fit in one or two AX.25 packets. Now, there is a
long long long list of options sent at each click, making the use of recent
WWW browsers over amateur packet networks far less practical than it was

before.

Besides, TCP/IP has not always been that great either. I remember well
that when I first used TCP/IP on packet radio (10 years ago), the only
package that would work was KA9Q's. Some people had commercial UNIX systems
with TCP/IP and routed them to amateur radio via KA9Q systems, and it did
not work because these systems assumed ethernet speeds and timing.
This has improved over time, and probably a lot of that was done or suggested
by radio amateurs at work.

>None of the protocols you speak of are forms of a BBS, either, except in
>some sense of store and forward. They are transport protocols, designed
>to reliably get mail to where its suppose to go. Not much like a BBS in
>the way they perform their job on autopilot, without any user
>involvement, except to first send a message or to tell a program to
>initiate downloading of mail. Look at it this way . . . say I send a
>message from NC over the BBS net. Every station it goes through has to
>have its operator hand forward every bit of mail that passes, the whole
>message having to travel many points before its arrival, taking who
>knows how long (definitely unpredictable).

You don't know what you are talking about, or the BBS net in the USA has
been really poorly setup.
Over here in the Netherlands (and surrounding countries) our personal
messages get to their destination in a short time, and without sysop
intervention.

>Now, set up the same network
>using TCPIP and the above, very standard protocols. The message is sent,
>scanned for indecency by some computer program at the first SMTP site,
>and then, wham, ping-pong-ping-pong, quite automatically and quite a
>bit faster, the message arrives at a pop server, perhaps three node
>hops from my own house, then I call to the POP server to send it,
>ping-pong, right to my house, that short span alone via BBS could have
>took several days.

This is utter nonsense. The slowness of message propagation is due to
network speeds, not protocols. You are comparing the BBS system to the
Internet. When you install TCP/IP on the amateur packet radio
network it is not that fast anymore.
(Believe me, we have it operating here for at least 7 years)

>How could you even continue to argue for BBSs? They
>burn computer time, air time (in that so much useable airtime is not
>used, which could be very valuable to say a telecom company that wants
>that airspace), consume volunteer hours and give to few people too much
>power.

When you shutdown the BBSes, the SMTP/POP/NNTP servers that replace them
will consime the resources instead.
As far as message forwarding is concerned, they will use considerably
more resources and take more time to do so.

(thanks to the innovative work of F6FBB in message forwarding, something
that the bright folks in USA BBS development or Internet protocol development
never came up with!)

>> In reality, setting up a packet radio station with TCP/IP is usually
>> more complicated than an Internet access, even if only because the
>> packet
>> radio protocols are not supported in the operating systems distributed
>>
>> by M$.

>If someone would contribute a NT and 95 DDKs, I'd fix this in only a few
>months.

I have seen such statements too many times before.

This is precisely the application.....Internet for outbound
long-haul messages. Much of the "important" recovery messages
were by businesses that needed to get an order to a
mainland vendor while the commercial local/long distance
phone network was down. For a while, messages were
flowing out of the disaster site over amateur radio to a
ham with a phone.

On Oahu, much of the metro Honolulu telco inter-office transport is going underground in large fiber rings. The inter-office transport also links large commercial sites, which could include governmental and commercial buildings. If a packet gateway could tap into Internet service via the fiber rings, it stands a high probability of surviving a hurricane strike. (We'd just lose all our residential and small business telephones and faxes and cellular sites, that's all. *grin*) That solves the Internet local loop transport.

There's also two fiber cable landings at opposite ends of Oahu for the undersea fiber cable that connects Hawaii with the mainland and to Guam, so the probability that the raw transmissions connectivity with the mainland is high that it will stay intact. However, as mentioned, we'd probably lose phone service while maintaining Internet service to the largest of commercial/governmental/military sites over fractional T1 links. Once again, a packet-to-Internet gateway is an ideal way of handing off long-haul traffic back to the mainland automatically. And, if you've ever had to handle the traffic by hand for the many hours that the hams did during Iniki, you'ld appreciate this small point immensely. The fiber rings between the LEC and the cable landings are hardended in concrete capped conduits. That solves the LEC and IXC transport.

So, all we really need is the feeder from the amateur radio operators in the field/headquarters, and the system is set (on paper). The amount of outbound and inbound traffic is limited by the bandwidth/service coverage of the amateur radio packet systems.

We have the reverse inbound traffic situation also solved for implementation at the right time. So, it is meaningful to pursue the above scenario provided other factors and objectives have been met.

There is value in combining the relative strengths of amateur radio and commercial communications technology for a high availability, backup emergency communications systems.....

The California Office of Emergency Services (OES) uses a system called
E.D.I.S.. Emergency Data Information System. It runs over 39 mhz with
.X25 packet and no special software to recieve it. It REALLY doesn't
have too much on it except for Weather Warnings and earthquake info.
You might want to send e-mail to Gary Morris (garym@cts.com) who can
tell you much more about the system.

I wonder whether people feel the same way about using leased lines (or
a wire strung thru the trees) to connect the two halves of a split-site
voice repeater?

Take a look at the RF modules at our web-site, able to send/receive
serial data up to 20 000 bps. Even if the page is in Swedish you
probably understand the specifications. The same modules is avaliable
from a company called ABACOM in the US if you live over there.

Probably because it is true.

>But today, we still have one large class-A net routed completely via
>Brian's system. It may be possible to have it another way, but at least

What gives you the idea that all routing takes place at ucsd? The primary domain *nameserver* is there, but we have other nameservers distributed throughout the system, each authoritative for its subdomain.

Individual *routes*, which are an entirely separate issue from name service, are held in routers on a hop by hop basis. Those are distributed throughout the networks, in every switch that must handle a packet. Routes are based on the *physical topology* of the data links interconnecting the various routers making up the internet. If a number of routers have been configured to point by default toward ucsd for net 44 traffic, that's a router configuration problem, and not something which is forced by having net 44 be administratively a Class A net.

The router problem is that a number of routers in the internet still function with static route tables, and the most convienent way to maintain static route tables is by cluster routing. That imposes a pseudo-hierarchial structure to routing which is not dictated by the protocol, the physical topology, or by the net domain naming system. But such static tables are becoming bottlenecks on the internet, and are totally unsatisfactory for mobile networking, so dynamic routing is going to have to be adopted more universally by the internet to deal with those issues anyway.

For merely intermittant networking, we've been able to kludge around the problem posed by static route tables through use of dynamic IP address assignment. But that won't work properly when we need to be able to maintain network connectivity while we move physically from switch to switch in a mobile environment. That requires dynamic routing or we'll be continually breaking the pipes to our applications. The Ricochet network is typical of that sort of usage today (as are a number of military IP networks).

This sort of usage is about to explode, and internet routers are going to have to adapt to it by properly supporting dynamic routing based on changing physical topology. That's why names, addresses, and routes have to be separate entities. Fortunately, the designers of IP foresaw this, which is why these things are separate entities in IP networks.

In <EBoFxo.B74@pe1chl> rob@pe1chl (Rob Janssen) writes:
>How are you going to convince the Internet routers that 44.0.x.x is to be
>routed different from 44.137.x.x ?

Pretty easy (In fact, too easy :-) It often happens when we do not want it too). We do this sort of thing all the time on landline nets. You point the 44.0.x.x routing entry (using the appropriate subnet mask) to the interface on the router that is shortest path to that net, and point the routing entry for 44.137.x.x to the shortest path to that net. If each router along the way is set up similarly, then the packet will follow different (an hopefully the shortest path) to each net. With the right subnet masks, I can take this down all the way to the host level.

There a a fair number of internet routing protocols that make this more or less automatic (depending on if they trust each other or not, etc), but that is the basic idea.

This is all grossly simplified, and I can go in to more detail or point you to a book if there are still questions.

Ahh. Now that is a good question. I will guess at an answer. Most routers to the ampr net are probably run by amateurs on both the radio and Internet side (by definition, right :-)). If they started advertising a path to their local ISP, that ISP would probably not trust it. BUT, if you work directly with your ISP and you can convice them you carry some authority in ampr toplology (I guess that could be a regional addressing authority of a ampr subnet) would at least advertise your route in their net. To get a broader range you work with the regional backbone providers. Now this approach has limits. You don't want to provide a shortcut for every radion LAN in to the Internet, but it is resonable on a regional basis.

So, there are no technical reasons, but it would require some small amount of Internet sophistication in the local Amateur community.

> you stop insisting on being so obstructionist and obnoxious ...

Why should I care?
It is trivial to do "wireline" networking.
It is non-trivial to do ham radio networking.
I'm not interested in the former.

> > Now those who wish to quibble will probably tell me "No, this ISP

Gary,

You on packet?
1200 baud? You are kidding!

Even our "long haul" links in this part of the country are 9600,
and we are planning the next upgrade now (56k probably, unless
something better becomes available soon).

HF is CLOVER mostly, which has faster data throughput than 1200 baud
packet. i.e. an incoming CLOVER connection can saturate a 1200 baud
point-to-point (only two radios on freq) packet link.

Remember, I'm talking store and forward here, not real-time
connections.

You want to discuss something OTHER than store and forward, that is
fine with me. However this particular discussion was about some
Land Line Lids bypassing our existing store and forward radio links.

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.tapr.org' in the directory
/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Via TAPR's listserv (http://www.tapr.org/tapr/html/internet.html)
-----------------------------------------------------------------
TAPR maintains several SIGs in various interest areas. To get the latest
list of SIG groups, send an e-mail message to listserv@tapr.org with
the subject line "Request" and the following text in the body of the
message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to
listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail
group)
```

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name should be both your First and Last Name.

Some of the current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS
TAPR-TNC SIG on TNC Issues
DSP SIG on general DSP topics
MIC-E SIG on supporting the TAPR APRS MicEncoder kit

TAPR-BB Announcement channel for TAPR bulletins and information

---

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in Spread Spectrum Communications ?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project was the first big project that TAPR tackeld and completed. Now TAPR covers a wide range of interets including: APRS, Spread Spectrum, networking, Timing, DSP, HF, and much more.

TAPR was founded in 1982 as a national organization with interests in the
areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur educational research and development
organization. TAPR currently has more than 2500 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively
on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is
recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back
issues may be obtained from the TAPR office. Membership in TAPR is $20 for
one year in USA, Canada, and Mexico. Outside North America is $25.

Join the amateur digital-revolution -- Join TAPR!

I believe you misunderstand the use of a Class-A group. All that means is that the number of hosts in the first-level subnet is expected to be very large (16 million). It's not a reflection of the connectivity. IBM also has a Class-A subnet, and 99% of those machines are not directly connected to the Internet either.

>
>When it would have been intented to be a well-connected PART of the GLOBAL

And 16 million addresses isn't enough?

>expediency.

That's funny coming from you, Charles. You've shown a total lack of reason, decency, and responsibility. You have absolutely no concern for the welfare of the LANs and MANs you purport to serve. You *demand* that they depend on your services, but you don't have the intelligence to realize that you aren't delivering the WAN services that they need.

You and Hank are full of insults for those attempting to find alternative ways to perform the mission of supplying WAN services to interconnect the LANs and MANs. Then you have the gall to act insulted yourselves when challenged to show that you have delivered on your promises to provide those services. Of course that is because you have *failed* to deliver WAN service to the LANs and MANs. That's so obvious, even you should be able to see it. Your bluster is just an act to obscure the fact of that failure.

If you really cared about packet networking, you'd welcome those who have come up with ways to deliver the services you've failed to deliver. But you don't care about interconnecting the LANs and MANs into a coherent amateur internet. You don't care about advancing the amateur networks. You just want to continue to play your little BBS games.

Now that wouldn't be so bad in itself, but you insist that everyone else play *only your BBS game* too. You demand that the LANs and MANs remain solely dependent on you for WAN service (which you've been unable or unwilling to provide). At that point you cross the line. You are no longer an asset to packet networking, you have become a liability. You've become a problem others are forced to work around.

In an ideal world, we'd be able to tie our LANs and MANs into a coherent amateur internet solely via RF links. I have worked within GRAPES in an attempt to do that on a State level for a number of years, and we've had some success. But it has become painfully obvious that coherent national and international WAN services can't be provided solely by amateur RF links. There are a number of reasons for that, some technical, some financial, some political. But the conclusion is obvious, we must find alternatives for WAN services which aren't solely based on RF.

That doesn't mean we are abandoning amateur radio. That means we are *augmenting* amateur radio networks with interties we can't deliver any other way in order to enhance our amateur efforts and make them more useful. We've recognized that amateur radio cannot do everything well. We use it where it serves us well, and we use other means where they meet needs amateur radio cannot realistically meet.

If you disagree with that, then I challenge you to show us how to do a global WAN capable of meeting amateur needs for network services to internetwork our LANs and MANs solely by RF. Note very well that that demands more than a packet version of NTS. It requires packet switched WAN service with a high enough capacity and a low enough latency to handle the applications amateurs wish to run on packet.

We are beginning to provide that on the LAN/MAN level via RF methods, and have a clear path to follow to improve it further, but there is no indication that you're doing anything toward
delivering the WAN services needed to interconnect those LANs and MANs. Nor is there any reason to believe that you ever will. You're not even working on the problem. You're not even
doing packet networking. You're just running a BBS that happens to use a radio modem instead
of a telco modem. You aren't providing *any* packet switched network services between LANs. Get back to us when you are.

One of the things I hate about Java APRS, is when you zoom down to
see a close in area (using MS Explorer browser) the program crashes...

Text is fine.

Well, yeah, but that's a function of the crappy MS software, not
JavaAPRS. It works perfectly fine under Netscape (on Linux, of course. :-)
Personally, I think javaAPRS is one of the neater applications that you
can run over packet TCP/IP. :-)

Not only that, but he hasn't invested even $5 into this fiction he calls a "network." I haven't heard of anyone in the Denton, Dallas/Ft Worth area getting any help from him. But then again, everyone with any sense stays clear of him. He's not a team player.

But I confess, this area of the country has always been a non-team area. We had a guy here locally that found unlimited antenna space (an electric co-op) formed a club with a tax exempt incorporation, and went to all the state clubs to speak. His goal was a mere 9600 baud. After a year he gave up. I was very interested and thought it was a great idea to
link the major cities. No money or donated equipment; no team, and you're dead. That's when I realized most Hams just want to exchange packets locally. Those that wanted to packet long distance did not have any money ($25 a year). You just can't get it out of them. For $25 they want it done tomorrow.

I'll tell you the biggest bitch with Ham packet radio: Lack of bandwidth. This little fact is
the source of all the ills. Little people (like the people in Lawton Oklahoma) who monitor the
1200 packet and shut down any time the "wrong" data comes across. Even 9600 has "wrong" data. The bandwidth (lack) is what drives people to circle their wagons.

The TCP/IP protocol isn't the problem, it's the fact that it consumes all the bandwidth when
it runs over a 9600 (or 1200) baud internet. Forget the fact that the dwell time is lower. I always hear about TCP/IP having too much overhead. But the fact is, the limitation is the TNC nodes. X-1 nodes can't handle segmentation. But with segmentation, the overhead is in one packet out of six (say with an MTU of 1500). It's kind of neat to watch it transfer a
file or mail over the repeater. Sure it consumes all the bandwidth. It would consume it all if it were 100 Mbps. How long does it consume is the question (the dwell time).

So if you find yourself bitching about lack of bandwidth, or "that" protocol, you need to form

a team. But the teams goal should be data transport, not "good" versus "bad" data. The goal is all data. Don't worry about consumption. You couldn't solve consumption in your lifetime. There's a rule that says any increase in bandwidth is offset by the number of users.

That's why I'm a stock holder in Low Earth Orbiting satellites. I think they will give consumers
more function on 2 m and 70 cm than Hams. I'm a consumer first, Ham second. Nothing is sacred when it comes to utility.

The only ones trying to cut amateur radio's throat are those who are fighting to keep amateur packet radio networks in the stone age. Those in the networking business know a hell of a lot more about networking than you do, Charles. And they are sharing that expertise with us in an effort to allow us to learn how to establish effective and useful networks. As professionals, they know that effective LAN, MAN, and WAN systems must take advantage of different media to accomplish the tasks each layer must perform. You can't seem to understand that.

If they were trying for a pat on the back from their bosses, they'd be telling us to use 300 baud HF BBSs on HF as our WAN. That would insure that our networks wouldn't be useful or effective and would guarantee that we wouldn't establish high performance LAN systems on the upper UHF frequencies their bosses want for PCS because there wouldn't be enough inter-LAN connectivity to make it worth our while to do so. In short, you're an idiot, Charles.

If we implement our radio segments properly, the only way to tell the
difference between the radio links and the wireline links is that the
radio links will be faster and will work mobile. Speed and mobility
are the two assets radio brings to data networking. If you can't supply
either, then you might as well not bother with radio.

DEAR FELLOWS:

My apologize if this post is not correct here!
I have an equipment ICOM IC-706 and I would like to extend the
frequency for 2 meters band. Actually, the 2M band is: 144 to 146
MHz, European Version.

I would like to extend the frequency from 144 to 148 MHz, used in
Brazil.

All information are welcomed and please, send your comments to below
address. Thanks in advance!

Vy best 73,

Hi,

This is a Solicitation Email, we are looking for new TUFF'97 DISTRIBUTORS.
TUFF'97 is a promotional concept for a prospect follow-up system called
"Simple Track". Software designed for Windows 95, 3.11 and NT
machines. (Macintosh users read the NOTE below(*))

Concept:

The TUFF'97 software includes a copy of Simple Track, so you can use this
for your own personal administration (free). However, the TUFF'97 software
is designed to give you BIG TIME credits for just taking the efforts to
PROMOTE it.

How do I get those credits?. Easy, just distribute/promote it. How?
(Give away the software for free, put it on your website/homepage
and let everyone download it. Give it to your friends, attach it by
email etc). With a one time $40.00 (USD) validation code purchase,
YOUR name becomes part of all sofware you sent out to your customers.
When your TUFF'97 software gets validated, all your personal information is
automatically integrated in the software, so everyone knows how to reach
you by phone/fax or email and where to sent the check/money or cash orders.

Basically this is the concept. Offcourse you need the software to grasp
the whole thing. Believe it, there is absolutely no marketing knowledge
required, just ask for the software package, join and start promoting your
own TUFF'97 line. The only thing you DO need is a PC or Mac(*) and Internet.

(*) TUFF'97 is only available for MacOS users running Connectix VirtualPC
or Insignia's Sofwindows 95/3.11. A true MacOS version is not available.

When you're interested in becoming a TUFF'97 distributor and create your own
distribution line, sent a mailto:FiReStArTeR@frodo.com and ask for your
copy of the TUFF software (We'll sent you a download location and install
instructions). This is a serious opportunity, so only serious responses
are processed. If you're not interested, have a nice day.
Best Regards,
Tony Scott

I recently "inherited" a Heath HN-88-99 PC with a CPM operating system
disk. The disk also has a copy of a packet radio terminal program called
"Maple" on it. Had no real interest in the computer, but now
that I've got it, I'd like to find out more and play around with it a bit.

Anybody have any information/documentation on "Maple"?

Thanks,
Paul Elliott

We've been using 56 kb here since 1987. It works, it's practical, and we've built a network using it. But we're an island in a sea of 1200 and 300 baud interties. There are a few other similar islands around the world where high performance packet radio is being practiced. But we have no practical way to tie them into a coherent network by radio. That makes our amateur efforts far less useful and interesting than they could be.

To really kickstart higher performance RF solutions, we have to supply these islands with interties adequate to make them more attractive and useful. People ask us, why should I upgrade to 56 kb if the network drops to 300 baud when I want to work someone outside the local area? That's a very valid question. It has limited our growth, and has inhibited other areas from forming high performance RF islands of their own. In fact it is worse than that. We can't even offer 300 baud interties. All we have now is a BBS kludge for message forwarding, and not a way to internetwork the high performance islands.

But if we can offer a way to intertie these islands into a coherent network, then we can get more growth in the existing islands, and give reason for others to form their own islands of high performance packet. The only way we can see to do that is to make use of the wireline services to provide those interties. The technical, financial, and political realities work against doing it in a totally RF fashion on a global scale.

56 kb is now relatively old technology, and TAPR is working on things which will be much faster. But that can all go for naught if we don't give people reasons to use

them. We've had high speed radios for over a decade, but we haven't given people reasons to use them because we haven't been able to address the WAN problem adequately via amateur radio.

Nor is it likely that we can. So we must start to take advantage of the wirelines to form the global WAN for us. As the islands of high performance packet proliferate, some will merge, and we'll be able to dispense with wireline interties between them. But the need for such interties aren't likely to ever completely disappear because not all of the islands will be able to merge due to topography and amateur population distribution.

Those who are fighting the use of wireline interties are really fighting against the growth of high performance amateur packet radio. One complements the other, and both are needed to bring us out of the stone age. As long as our network performance limits us to only a few trivial applications done by only a few people at a time, packet won't attract the critical mass needed to break it out of the limiting paradigm in which it is currently mired.

Remove all the wire from your station, Charles, and then get back to us, if you can. Even you don't communicate completely without wires. Whether the wire is a RS-232 link, or an ethernet link, or some other wired link, there are still wired connections in your path. Radio makes up some of the links, but not all of them. Why are you using wires? Could it be because it makes more sense to use wires for certain jobs than to use radio? Could be.

>Well several folks (including myself a few weeks back) mentioned mobile (in
>the LAN/MAN context). I am curious at to why you do not consider this a
>valid answer. It seems so obvious to me, that I must be missing
>something.

It was mentioned, but not explained. I fail to see where "mobile" makes any difference at all to this discussion. Commercial radio connections already exist to the Internet for mobile apps, probably at cheaper cost and higher efficiency than similar amateur radio devices. The commercial applications will improve rapidly as demand increases.

This brings me right back to my original question: For those of us with ready access to the Internet, what's the reason to use ham radio to connect to the 'net?

Of course, on the other side of the coin, the anti-Internet folks have not answered my question about why those of us with functioning LANs and no connection to the rest of the ham net should not be allowed to use the Internet to move traffic to and from our LAN.

These are complex concepts, seems to me, and are not well served by namecalling and obfuscation. The simple, observable fact is that easy Internet access has a chilling effect on further development of the RADIO portion of the ham network, and it's only going to get worse as Internet access becomes more ubiquitous. It's not hard to imagine a scenario where ham packet will completely disappear, and a bit more imagination might suggest that even much of the voice portions of ham radio may wither as well.

>
>Gary,
>
> You on packet?

Yes, I've been on packet since the beginning. I even ran a BBS on a Xerox 820 many years ago. I gave that up when it became clear it was a dead end and was draining energy away from the goal of achieving a packet switched data network.

> 1200 baud? You are kidding!

Nope, I'm not kidding. Outside the GRAPES network of 56 kb LANs and trunks, and ALANET's 9600 baud backbone, we're back to unreliable 1200 baud links, or even worse, 300 baud HF links. It can take a couple of days to get a message from our 56 kb LAN to the Ottawa 56 kb LAN. That's absurd, and we still don't have interconnectivity on a packet switched basis. So we don't have a packet network beyond the local level.

> Even our "long haul" links in this part of the country are 9600,
> and we are planning the next upgrade now (56k probably, unless
> something better becomes available soon).

But how far does your "long haul" span? Here, our high speed network only covers the part of our state with a high density of amateurs. We don't have the manpower or funds to service the low density areas now. We service 90% of the state's amateurs,

but slightly less than half of its geography, at 56 kb.

> HF is CLOVER mostly, which has faster data throughput than 1200 baud
> packet. i.e. an incoming CLOVER connection can saturate a 1200 baud
> point-to-point (only two radios on freq) packet link.

I know about Clover. I'm using it on HF. I've run PPP links over Clover. It is very slow and low capacity by the standards of our local network, but it does work. It doesn't have either the speed or capacity to serve as a viable WAN network transport, however.

> Remember, I'm talking store and forward here, not real-time
>connections.

I'm talking about WAN service to our LANs. That includes much more than message level store and forward, though that can be accomodated too. BBSing is just an *application* and isn't packet networking per se. When you and Charles started talking about a global packet network, that implies much more than some BBSs doing a message store and forward application by radio (often not even using packet switched transport protocols). It doesn't begin to be a wide area packet network until it can switch packets between LANs.

To an extent, the existence of wide area BBS forwarding has served as a brake on packet switched WAN development. It has allowed amateurs to bypass the packet network for out of area message delivery. Thus there has been less work done to solve the WAN problem than if the BBSs hadn't existed.

I could suggest that your appelation of LL LID is misdirected in the sense that it is the BBS LIDs who have been harming WAN development by short circuiting the demand for LAN to LAN switched packet interconnectivity. But I'll refrain from calling names and assigning blame at this point and simply note that the objective is to unify the separated amateur radio LANs by a WAN supporting packet switched interconnection.

The BBS forwarders aren't doing that. There isn't much chance a global packet switched network can be done solely via amateur radio. The use of wireline wormholes can allow amateur radio LANs to internetwork worldwide on a packet switched basis, however. That is greatly beneficial to amateur radio packet operators because it allows a plethora of new applications which can't be supported when the LANs are isolated from one another. It may reduce the need for BBS forwarding, but that's an acceptable tradeoff to me. That wasn't getting the job done, and it was harming the development of high speed local LANs by keeping them disjoint.

For what? I wouldn't want to be associated with the "speakers" normally found at Ham-Com.

For years now, a group of speakers there have been begging and crying for hams to support the growth of TexNet, and other packet networking efforts. Now, these same "speakers" have the gall to step up and tell those same hams that all that they have contributed to for the last ten years is obsolete, useless, and must immediately be replaced by non-ham means of communication so that a clique of snotty TCP/IP fanatics can PRETEND that TCP/IP is worthwhile as an amateur packet radio networking solution.

Greg Jones, Phil Karn, and other "Radioless Ham Radio" fanatics have essentially succeded now in discouraging, disgusting, and running off many of the hams who used to enjoy being a part of amateur packet radio, and who used to feel uplifted and proud when they went to Ham-Com to join in the packet radio seminars, and hear the "speakers" there.

The last Ham-Com was a bust, and even fewer hams bothered to show up this year despite lowered entrance fees, free parking, ect.

I'm sure that LandLine Lids can come up with a "reason" for the lack of interest in Ham-Com, undoubtedly a rationale which places ALL of the blame on the general amateur radio community. They will run down amateur radio, amateur packet radio in particular, and all of their fellow hams in general.

That's exactly the kind of "thinking" which has managed to kill off Ham-Com.

That's exactly the kind of thinking hams have come to expect from, and associate with "LandLine Lids".

So look at something a little different like ATM.
Very small packet size, fixed length, no error checking, 5 octet header.
One could see some very interesting variations of this for packet radio.

I'm sure Frame relay is not far behind.

It would seem with all the advanced sound processing capabilities of the sound card available in the PC environment, someone would have written a program to replace the TNC using the sound card. Does anyone know if this has been done or maybe its a work in progress... I would be really curious... I really dont need another piece of equipment sitting on this desk...

Well, if you use Linux, the newer AX.25 drivers include one that will
allow you to use a sound card as a TNC.

Have a look at

http://home.pages.de/~flexnet

or especially

http://www.afthd.th-darmstadt.de/~flexnet/sm.html

for information on PC/Flexnet. It offers 9k6 or 1k2 packet radio using
various standard sound cards. PC/Flexnet runs under plain DOS or Windows
95.

There are some other applications for the sound blaster available (i.e.
meteor scatter, RTTY, CW...), but I don't have any information here.

<much more along these same lines>

I understand all this reasoning very well, Gary, but my primary
question remains: If we use the internet to tie LANs and MANs
together, what incentive is there to develop new radio links and
expand/improve old ones? Now that the Internet is available at low
cost to almost all of the USA, why would anyone spend thousands of
dollars to build a high-speed ham LAN when each ham already has or can
easily get an Internet connection? If the 'net had been available
here when we started building our LAN, I doubt very much if we'd have
done it. I just don't see any practical way you can mix ham radio and
commercial "wirelines" and not have ham radio suffer.

The incentive is still there. There is no incentive for low baud rates,
that is the major point. Forget all the pro and con of Internet tunnels.

The incentive is high baud rate links. If you could link Casper, WY
with Cheyenne WY, what would be an incentive? 1.2 kbps or 115 kbps,
or a 33.6 kbps tunnel? That's right, 115 kbps, very good. Now, how
do you get that speed? Spread Spectrum, right! Very good. Now how
many nodes does it take? Correct! oodles, and oodles. How much
does an oodle of nodes cost? Right again! good boy. I just can't see
why Hank and Charles are so blind to this. It is because these SS rigs
will be pure IP at the user port. That's really the crux of their argument.

There's the incentive. TAPR thought they could do it for $400 a pop.
I think within 5 years you will be able to do it with an antenna included
at that price. Right now, there's no boilerplate. But at that price, Hams
will go that to get the speed. But keep in mind, each node will be lucky
to do 30 miles. Last time I checked, there's a few 30 mile hops between
most major cities on the Plains.

Would I go SS at $400 a node? You bet. I'm paying $220 a month for
32 IP addresses. I could go 6 nodes in a year at that price.. That means
I pay $7 for one IP per month for the capability to tunnel, or about $85 a
year for people to exchange weather reports and chat. It's quite a waste,
but I do it because I like to program. Right now I'm having a ball with
Mysql database and distributed clients. But if I could replace all my
modems with radio's, it would be very much cheaper: read that, an incentive.

>
>Mike, could you elaborate a bit on this program and what it does?
>
>Carl - wa6vse
>wa6vse@fast.net

Hank's Netwalker program can be pointed at a distant RF node. The
program searches out any and all links which it finds along the
way. Reporting back to the original executer of the program, info
relating to interconnecting links, qualities, routes status..etc.
In short is spreads out over the network like a disease gathering
interconneting network info and reporting it back to Hank.

Hanks has stated he uses the program to gather the information
to help others understand the RF networks to improve them. However,
very, very few network node operators ever see the output data
retrieved. Hank keeps it for himself to fuel more propaganda.

The Netwalker program creates a tremendous load on the RF links.
Hank has used phoney callsigns such as N7QRM, or WB7QST to do
end runs on node operators who DO NOT approve of such data
collecting programs congesting the local networks for Hank's
specific mission.

Being between WB7DOW and W0RLI in the RF network has NOT been
a picnic. I've seen many who would LIKE to improve our local
networks, but electing to delay, simply due to Hank and Glens
non-sense. Neither of these fellas, regardless to their past
contributions to RF digital radio, will EVER be friendly to

the mode.

I'm happy to find many of the supporters of the digital mode finally waking up and truely seeing WHY our "local" network remains stagnated. Local operators and "supporters" are NOT willing to develope a playground for these two "victims of themselves".

You *really* don't understand Internet addressing, do you?

There is no inherent difference between 44.x.x.x and 200.x.x.x, except that by the Internet standards for addressing, 44 is meant to be handled as a monolithic unit, while 200 is meant to be broken up (44 is class A, 200 is class C). This difference is less relevant than it used to be due to CIDR. (And, if you don't know what CIDR is, you have no business talking about Internet addressing.)

{deletia}

>How are you going to convince the Internet routers that 44.0.x.x is to be

I'm not trying to prove anything. I'm giving all sides a chance to
convince me.

>You are hilarious. You presented no opposing reasoning in your reply,

I'm glad I amused you. It's obvious you need more humor in your life.
I wasn't trying to present reasoning, I was trying to cut through the
boilerplate bullshit to get to the meat of the discussion.

>just emotion. Obviously trying to debate anything with you is a total
>waste of time on my behalf, as you dismiss everything as if you sat upon
>a pedestal above us all, knowing the answers and allowing us to figure

That sounds remarkably like your own attitude.

>them out on our own. Well, you obviously don't have any rational
>arguements, reasons, etc. for keeping TCPIP out of packet and you aren't

I don't recall saying that TCP/IP should be kept out of packet. I
said it didn't impress me. The folks who played with it for a few
weeks and then disappeared impressed me even less. Watching 24 solid
hours of retries by a TCPer trying to transfer a megabyte file over a
shaky 6 hop node link didn't amuse me all that much, either,
particularly when the total packets wasted totaled far more than the
size of the original file, which finally aborted before it was
transferred. BBSs could have transferred the same amount of
information over the same path in far less time with far less waste of
bandwidth.

>going to listen to mine for using it, so I think its time for me to
>withdraw from this debate that is soon becoming flamewar.

It's a bit late for that.

>Never again,

Promises, promises.

>PS: I think this is what you, Hank, and Charles wanted anyway, was for

I have no idea what Charles wants. I don't know him. I have a bit better idea of what Hank wants, since I've seen his work and corresponded with him from time to time, but you're sadly mistaken if you think we share the same opinions and agenda. Lumping your opponents into a single category and then demonizing them is a familiar tactic, but it's fairly easy to see through for anybody who's listened to an expert like, say, Rush Limbaugh practice it. You're so blinded by your zealotry that you've paid almost no attention to what I've been saying here.

>us to give up. Well, I give up trying to explain anything to you, but
>not to anyone who is interested. So, may you know now, my IP over radio

Why in the hell would I be here exposing myself to the constant insults and condescension from people like you if I was not "interested?" It seems to me that you have no rational, well-thought-out and organized argument, so you just bluster and bluff, and then run off when questioned closely.

>recruiting is far from stopping, I am just halting my waste of creative
>energies trying to explain anything to you and your anti-TCPIP crew.

I'm not part of any crew, "anti-TCP" or otherwise.

Perhaps it would be better if you'd read what's written, and follow
the attributions, which you have either deliberately or accidentally
screwed up here. I was not the person who "discovered" anything about
who does and who does not use packet. I have no particular interest
in wandering down your little garden path, sorry.

(I've left the post complete, just so you might get a clue who wrote
what here. Sorry, but I don't feel like looking back through the
articles to restore the stuff you screwed up.)

As David notes, amateurs have a tradition (which is also a charter responsibility)
of working with the communications SOTA. Data networking in a mixed wireless
and wired environment definitely qualifies in that regard. I'd also add that such activity
furthers the role of amateur radio as a training and education service by allowing the
amateur to gain hands-on experience with the RF, protocol, and interoperability issues
involved in advanced networking. And as he further notes, this can contribute to emergency
preparedness, also a charter amateur radio function.

On a somewhat less idealistic level, use of high speed wireless networking can
be faster than just using basic wired internet access, and it can allow a degree of
mobility and portability which a wired connection alone cannot. There's also another
reason to do it, which is harder to put into words, and that is because we *can*. This
is sort of like the mountain climber's explanation. It is a novel thing to do, and it is
interesting to try.

>I've seen TCP/IP operating on ham packet. I was not impressed.

That's probably because you've never seen it work over a competent
RF infrastructure. And it may be because you've only seen it used in
a quasi-standalone manner on a primitive single tasking OS, in much
the same fashion as amateur BBSs are typically used. When serving its
proper role as the internetworking transport protocol for applications, it
is quite impressive. For example, it allows me to run an xterm to any of
the applications I may wish to access on one of the servers in the network.
It allows me to remote mount a file system on my machine for collaborative
work. It allows me to exhange digital voice with another operator. Etc.
That's all with the same transport, and at the same time if I wish.

><irrelevant stuff snipped>
>
>>BBSs are slow, dependent on each operator in the so called "network".

>>by that time the national guard has gotten there and set up REAL

>>communications equipment. I don't see why you can't see this.
>
>None of this has anything to do with Radio vs. Landline.

Of course it does. David is saying that the BBS "network" doesn't satisfy emergency preparedness needs. That's mainly because it doesn't have the performance or capabilities of mixed wired and wireless systems such as those used on a commercial/military level. But by using proper techniques, we *can* provide services in a disaster area which *are* equal to, or superior to, what the commercial/military world offers. That's because of our first responder status of already being on the ground in the area where communications are needed.

TCP/IP was developed under military contract (DARPA) to be a robust CCC technique intended to maintain communications under adverse battlefield conditions. It proved itself in the Gulf War. Both Coalition and Iraqi forces used it. Try as the Coalition might (and it tried *very* hard), it was unable to knock out the Iraqi CCC systems. That's because of the ease with which packets could be rerouted around damaged switches and lines or around radio links which were being jammed. It isn't dependent on a particular underlying transport structure. It is equally at home on the radio or on a wireline. This robustness in the face of damage is what makes it well suited to serve in a disaster communications role.

Now because most amateurs have been using only static routing, we haven't exploited this packet switching capability to a high degree as yet. But we certainly *can* and should. In fact it is going to be essential in order to service the demands of mobile operators. This is an exciting area, and one where amateurs are uniquely equipped to participate as more than camp followers.

BBSs are an *application* which can run on top of a internetworking protocol. Currently many amateur BBSs *don't* run on top of an internetworking protocol, and that is one of the problems with the BBS "network". We need to stop thinking of the BBS forwarders as providing network services and start thinking of them as running an application, like a usenet newsgroup, which provides a message distribution facility over any available underlying network infrastructure. When we start to do this, we see that the BBS, or the equivalent newsgroup and Email functionality of other applications which serve the same need, can be a valuable contribution to emergency preparedness. Currently, they *aren't* in most cases because they lack that underlying structure to give them the speed, flexibility of routing, and robustness needed to serve emergency functions. That's because they've tried to be the network as well as the application, but haven't done it well because they inherently work at a level of functionality ill suited to do so.

>OK, you're going to go with the Internet. Fine. I like the 'net
>myself. But it isn't ham radio, and the more you mix the two, the
>less radio you will have, and the more landline you will have. The
>reasons for this are too obvious to have to explain them over and over
>again.

It is *not* obvious that internetting amateur radio packet networks with other networks, such as those which make up the global internet, is any less "ham

radio" than tying an amateur voice repeater to the telephone system via a patch. Both are attempts at internetworking for the benefit of the amateur radio operator. In other words, they should be viewed as *augmenting* the communications services amateur radio can provide.

The idea that amateur radio must be "pure" simply means it will be much less useful, effective, and robust than it needs to be to serve a role in meeting the communications needs of the communities it serves, particularly in emergency and disaster situations. Instead it needs to work with other systems to provide communications which are as flexible and robust as possible.

Attempting to "do it all" via amateur radio is doomed to failure. The resulting system won't be able to "do it all", and will be difficult or impossible to make interoperate quickly and seamlessly when called upon to do so. We need to look at amateur radio as just one facet of the total communications infrastructure. Our goal should be to design our systems in ways that allow them to seamlessly interoperate with those other systems, augment them, and to some extent replace them at need. We can't do it all, but we need to do our part.

Largely, that part is to serve as the local loop. That's where the features brought to the table by amateur packet can be most useful. Realistically, we cannot expect amateur radio to serve as global transport. There are technical, financial, and political factors which limit any such attempt to a grossly inadequate level.

We can, of course, continue to experiment with such thin nets (there are some interesting things we can try at HF, and with satellites), but we should be smart enough to realize that they are, and will continue to be, too thin to meet the needs of internetworking the amateur radio LANs and MANs which we *can* do well. If we don't use the facilities offered to us by the wireline providers to internetwork those LANs and MANs, we will severely limit and shortchange what we can accomplish.

>to point out one thing. If we forsake radio links for inet we will
>LOSE some precious frequencies to Motorola, Microsoft, Apple, Netscape
>and others who would LOVE to have them for PCS services.

I find all this highly interesting. Digital radio operators discussing the demise of radio networks, on inet. Specifically two individuals whom have contributed, possibly, the most damage to the radio digital networks in Oregon, W0RLI and WB7DOW. These two individuals have chased off more interest in digital radio than their expertise may lead you to believe.

Hank's Netwalker program currently continues to probe to this day for the sole purpose harrassment. There is absolutely NO known constructive reason for this program to be turned loose on the HF, VHF, and UHF radio networks. NONE!! Yet, it persists. You fellas want digital mode to flourish? Then encourage the demise of the Netwalker.

The past and current activities of W0RLI on our radio links DOES NOT encourage growth!!!

I wonder if there's a version of Netwalker that circumvents the Internet networks. Scary thought, huh? If Netwalker would be frowned upon Internet networks, then why is it freely used on the radio networks?

Hello All;
I'm selling the "MFJ-1270CQ: MFJ TNC-2 Packet Controller Turbo Plus"
with the 9600bps modem installed. This tnc/modem has all the features
of the "MFJ-1270C" plus builtin 9600bps G3RUH modem for 9600bps AX.25
and 9600bps AFSK operations.
The MFJ-1270CQ is fully TAPR TNC-2 compatible with KISS interface,
MFJ Host mode * Anti-collision technology * Enhanced personal Mailbox
Plus Much more.
Included are all original docs, manuals, box and accessories. This
unit is still under MFJ's Unlimited 100% Warranty. It has less than
4 hours use. It's Basicly New Out Of The Box!..Reason 4 Sale: I just
bought the new AEA/Timewave DSP-2232 that includes all PacSat modes,
Wefax, SSTV & more.. Also I am a non-smoker
New it sells for around $229.99 +shipping. Asking $195 +shipping.
All cash offers will be considered..
Please call 1-609-386-9382 10am to 10pm Eastern Time..

Hmm... packet started in 1984 ?
And in 1980 1200bps modems were like 56.4K are today, the cutting edge.
Most people didn't even know what a computer was in 1980. Those who did,
thought they looked something like ENIAC or at best, the big box with 1000's
of LED's and voice synth they saw on "Wonder Woman" !!!
Your average Z-80 system then Cost about $5000, 16K of RAM cost $200.
I'd dread to think how much it cost to build a TNC then taking into account
monetry factors.

>I got out of packet radio about 10 years later simply because of the fact that
>the "radio" part of packet radio wasnt going anywhere, ie after 10 years
>amateurs were still using 1200 bps when alternatively technology was flying
>past them .

In 1990 the fastest phone modem was 4800bps.. most people had 2400 and
rumours of 9600 were getting about.

>Even today in 1997 the "radio" part of packet radio is still dawdling along at
>the sickeningy slow of 4800 bps.

>I tried with zero success to get amateurs here in Canberra interested in 9600
>bps back in 1985 and got basically no interest whatsoever.

Basically, if you were saying these things when you say you did, you were
WELL ahead of you time, which is why nobody was either interested or could
afford it.

Today, I'd just love to get a 56 or 128Kb radio modem and radio off the shelf
and would be quite happy to pay +$500 for such gear, but they are as scarce
as Lake George Scuba divers !! Even this is still a little to slow taking
into account that it is being used for LAN/WAN with a high rate of errors and
collisions. 2MBs or 10MBs is what we want these days. (nobody is listening
because this is WELL ahead of current 1200bps AX.25.)
The equipment is available OFF THE SHELF RIGHT NOW and for 2.4GHz,
but I'll be fucked if I can get one company in Australia to sell this shit to
me or even return a single phone call. Obviously this stuff is selling like
hotcakes and they don't need my money.
Instead I continue to play 10GHz using ethernet at 10Mbs.
There is heaps of potential to develops shit like this further, and I don't

have all the expertise to make it work to full potential.
Clubs and meetings would be a fantastic place to develop the stuff,
but nobody makes the effort to turn up to these unless politics or money
is involved. Most of those who do turn up, couldn't be bothered bringing
alone any gear or tools etc, prefering to chat happily about the fam or the
band opening on 20m yesterday etc etc etc.
Maybe disecting a project on the bench at a club is a little too difficult
and draging some of the gear along a hassle. Not to mention some people
have travel a few extra kms.

New ideas just keep popping into my head every second.....

got to run off and test a few.....

It's hard to accept the fact, Glen that SOME simply went too far, and some STILL don't get it. No matter the specifics of your arguments, then and now; you simply can't constantly badger active participants of a mode in amateur radio without eventually killing off their desire to enjoy it. Of course, some WILL continue to badger, with a loftier mission in mind, in which case, the ultimate goal IS running off the opposition.

When are you going to wake up to the fact that you are being USED by Hank? Most everyone else eventually has seen through his game. Quit riding on his platform; you're only there because you're easily engaged and manipulated. Surely you're more perceptive than this.

?? PTC-III ?? Probably you meant the PTC-II.
That's the kind of typo which generates lots of questions and rumours.
But maybe this was the only purpose of your notice...

>Mike, could you elaborate a bit on this program and what it does?

Better yet, elaborate on that crack about how much damage WB7DOW has
managed to do networks in OREGON, and how, exactly, I could have
managed that when I'm 50 miles from the Oregon border, and 400 miles
from any major population center in Oregon. This should be
interesting. The fact that Mike would mention my "expertise" in the
same sentence as that of Hank Oredson's should give you a bit of a
clue as to the credibility of the rest of his tirade. It's nice to be
so well-remembered, I guess, even several years after I did have some
small effect on any networks outside my immediate area.

Go for it, Mike. This could be interesting. I may even have to drag
out some of the old archived material to share, just to entertain the
group with just how much "fun" packet was in the PNW back when anybody
cared enough about it to keep an actual network running.

Carl, it's obvious that you were born knowing every godddam thing in the world, without exception. It shines through with every word you write. You know it all, and everyone else is a (insert boring, unimaginative insult here).

Now, I suppose it comes as somewhat of a surprise to an omnipotent sort such as yourself, but some of us were born ignorant, and remain ignorant in some areas for long periods of time. To correct this ignorance, we like to solicit information from others. Rather than relying on third-hand rumors and biased reports, we come here where we can ask the people involved directly before we make up our own minds. Sometimes we don't get enough information, or don't understand it fully, so we solicit more information. Are you following me so far, Mr. Omnipotent?

The fact that I haven't come in here with a preconceived notion and proceeded to attack anyone who disagrees with that notion seems foreign to you, and for good reason. It's something you've evidently never tried for yourself.

Now do all of us a favor, and keep your oft-broken promises to stop responding to my posts. There's nothing to be learned by reading anything you write, once you've spend ten minutes learning your brief list of feeble insults. You aren't even a competent flamer, Carl. If you had any self-respect at all, you'd slink out of here in shame for all the ill will you've created for hams among the many people who read this newsgroup.

People like you make me ill. All you do is brag and insult. You never actually do anything for the hobby. And if you, by some chance, actually have done anything for ham radio, it's all been counteracted by all the damage you've done here.

Do ham radio a favor, Carl. Get another hobby.

Oh, and as for that crack about my not insulting Hank -- I treat Hank as he's treated me. I've "known" Hank for many years, and not *once* has he called my any names. I return the courtesy, even when I disagree with him, which I've done on many occasions. Hank is ten times the man you'll ever be, which probably explains why you're so insanely jealous of him.

It's an intriguing problem. Are the impairments primarily due to
transmitters/
receivers or due to reflections in the radio path ? If the radio path
is the major
impairment then there are ways of attacking the problem for certain
cases...
perhaps not as a general solution but possibly useful nonetheless.

3422. Question anout Pico Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-16 00:00:00 UTC
From: toms@inconnect.inconnect.com
Message-ID: <5o3qea$vv2$1@news.inconnect.com>
Source record: 29184

I am creating a mobile APRS tracker and I plan to use the Pico Packet. One of the features I discovered is that if a computer is connected to the unit, it will stop sending out the tracker info. What I want to do is have a switchable method to get the unit to not send any packet. My plan is to hook up the mobile Pico with the GPS unit into a Yaesu FT-8000. The idea is that I will leave the main frequency on the APRS frequency. However, when I want to talk, I will move to a repeater to transmit, but I want to eliminate the sending from the unit. I know that the speed (1200/9600) can be set by memory in this radio, but I wonder if I can enable only packet on certan frequencies.

My current solution is to tie DCD high with a switch in the dash, but a more automatic way is desired.

Any ideas?

I've just uploaded a photo of Yaesu's new pager-sized dual-band "micro-HT". That's right, the size of pager... 1/2 watt on internal battery or 1 watt with external supplied power. Yaesu was showing this radio at the SeaPac Ham Radio Convention and ARRL NW Div. Convention at Seaside, Oregon on 6/14 and 6/15. The radio is said to go on sale on July 1st.

Ham Radio Online is a free online web "magazine" about ham radio. No ads. Its run by volunteers. We have nothing to sell. Come enjoy our web site at http://hamradio-online.com

Well, the same thing could be said for cell phone vs VHF/UHF mobile/repeater. As far as this goes there is NOTHING in ham radio that cannot be done in a commercial offering. I claim ham radio vs. the Internet is a red herring in this regard.

So why do folks do folks do ham radio (or other similar hobbies) at all? We all, of course, know the answer to that. We do it because we like futzing with the internals of the process/technology and we like hanging with folks who share that interest.

But that being said, there are a few big holes in radio-based mobile IP deployment that we can fill in the amateur community. So here are some generally-available radio LAN/MAN commercial services I am aware of:

RadioMail-style services based on RAM/ARDIS. These are pretty pricey on a per-byte basis and application level throughput is pretty low and limited to a email-style gateway (no direct TCP/IP support). Coverage in rural areas is not universal, but is sometimes available. They do have the roaming down pretty well. A well-designed amateur IP LAN/MAN that supported mobile IP and IMAP/POP style could handle this pretty well.

CDPD. Still pretty pricey on per-byte basis, but good native support for TCP/IP in most offerings. Throuput is about the same as current 9.9kbps amateur packet networks. Generally not available in non-urban areas. Probably is available in all major urban markets. Intra-urban roaming works well, but not inter-urban.

Ricochet - Great stuff where it is available. Native support for IP. And throughput is relatively good by today's expectations. Current coverage in only a VERY few cities and its not clear how they can get the capital to cover all major cities unless someone buys them up. Because of the small cells, not clear how they can cover non-urban areas (BTW, for this discussion, suburban is considered to be urban).

Cellphone modems - Very expensive from a connect time standpoint. Throughput about same as previous two (if you use the right gear and config). Coverage can be as good as the cellphone system. But only works well if your provider puts in special modem banks to handle the different modem error recovery mechanisms for landline vs radio (i.e., *DATA service). Since you get the IP part by dialing an ISP, roaming is as good that offered by that ISP (which can be pretty good for client-server stuff and generally bad for peer-peer TCP/IP services).

Satellite - Both very, very expensive and pretty low throughput in current offerings. The promise for the future, I guess. The most likely to offer something as good/better as Ricochet in the next 5-7 (?) years. But the capital expenditures are huge, so I wonder what the pricing will be in that timeframe.

Bottom line... None of these are so compelling that there are not significant niches for amateur radio TCP/IP networks. Some advantages we have:

Can put in the services needed by the local community (e.g., coverage in rural areas). This is, of course, assuming you can get the community to agree what is needed :-) (Which is the problem, here. Right?)

Where there is an active experimentor's community -- Quicker deployment of new technologies. This may conflict sometimes with stable services, but the decision is left to the users of the network.

Looking at what is available today, I actually think it may be cheaper to deploy amateur radio nets from a cost-per-byte and connect time basis. Those amateurs who complain about the cost of upgrading to 9.6/56kbps would have a fit if they priced active use of, say, CDPD or RadioMail.

There are always benefits to having a redundant system for emergency comm.

And, the most important -- We don't get to futz with the internals
of any of the commercial services.

As a side note, I see nothing in the above that suggest that it is
a good idea to ALWAYS preclude use of landline IP to provide connectivity
where it is needed to move things along. I agree that if you do it
too much then the challenge goes away. But to keep an active community
things need to be hard enought to be interesting but not too hard
to create despair.

Nother side note. Back in the earlier days of MBONE experimentation we used
to get excited about the rare "DX" from NZ, South America and ships in
Antarctica. (MBONE is an IP multicast overlay on the Internet that allows
"broadcast-style" streams. Mostly used for many-many audio/video apps such
as conferencing). Never did the QSL-card thing tho... No contesting
either. But we probably would benefit from Amateur-radio-style testing. I
can imagine one of the questions from the MBONE Novice question pool.

N1F01: What TTL must an MBONE video sender use at all times?

A: 255
B: 128
C: 4
D: The minimum neccessary to communicate

Call for Papers
[reminder]

1997 ARRL and TAPR Digital Communications Conference
October 10-12, 1997
Baltimore, Maryland (minutes from BWI airport)

Web: http://www.tapr.org/dcc

It's that time again! Time to mark your calendar and think about what to publish for the upcoming 16th Annual ARRL and TAPR Digital Communications Conference.

The 1997 ARRL and TAPR Digital Communications Conference will be held October 10-12, 1997 in Baltimore, Maryland. This year's conference location
is just minutes away from the BWI (Baltimore/Washington International) Airport.

For full details on the conference see http://www.tapr.org/dcc or contact the TAPR office for the DCC information flyer.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by August 20th, 1997, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to lweinberg@arrl.org. Information on paper submission guidelines are available on-line (http://www.tapr.org/dcc) or can be mailed.

Contact TAPR to register of for more information on the DCC.

Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ

Hello everybody !

I would like to know if know a software wichi generate and decode the
BEEPER paging. I have in 148.400 a lot of sound kind of BEEPER paging and
I would like to read them on my screen.

Do you know if it exists something similar ? Perhaps with the soundblaster
card it can be do ?

I am also interesting fr the protocol used for BEEPER. Does they use CTSS
tone ? How does the protocol is ?

Any comments are welcome ! Many thanks.

traceroute.

>The primary
>domain *nameserver* is there, but we have other nameservers distributed
>throughout the system, each authoritative for its subdomain.

I am not talking about nameservers but about routing. A different thing.

>Individual *routes*, which are an entirely separate issue from name service,
>are held in routers on a hop by hop basis. Those are distributed throughout the
>networks, in every switch that must handle a packet.

That is why the "an address is not a route" dogma cannot be held up.
It is impossible to have a routing entry for each and every system in
each and every router, and therefore only route entries for entire *networks*
are stored, not for individual systems.
And because amprnet is only a single network (instead of a cluster of networks
as it should have been), there is only a single route for all 44.x.x.x hosts
in most Internet routers (or all of them? I never encountered another route)

The difference is that for an entire 200.x.x.x block, there would have been
65536 possible route entries in the routers, so that each region could have
had its own route. Entire countries could still have been clustered to
a single route.

>the number of hosts in the first-level subnet is expected to be very large (16
>million).

But that is exactly what I wrote, isn't it?
The Internet is made up of individual subnets, which perform their own
internal routing. The subnets talk to eachother via the Internet routers.
Our subnet is world-spanning, but we do not provide our own world-spanning
internal routing. Hence, we don't have full connectivity.

>>When it would have been intented to be a well-connected PART of the GLOBAL
>>Internet, it would have been given enough network addresses to give every
>>region or country an opportunity to connect to Internet.

>And 16 million addresses isn't enough?

Those are host addresses, not network addresses.

>route.

If it were that easy, why isn't it done that way?
You don't want to tell us that Brian knows so little about Internet routing
that he sets up a system with no purpose, do you?

I've been on SCS's Web site several times and they don't show it
there. It appears that it's a military system - but the front panel
looks the same as the PTC-II with the exception of a III instead of II
as is in my controller.

Another fellow is supposed to be checking with SCS to see what the
story is.

Hello:

I am new to packet, and just bought an HK-232 TNC. I understand it is the same as the PK-232. It looks the same.

My firmware is dated 1987, and does not contain the KISS handler.

Does anyone know if/where a firmware upgrade is available? If not, is there source code to the TNC, to where I might write a KISS module?

Thank you.

Mike considers "wireline" as competition for radios, but really those sort of judgements depend heavily on your point of view - Where you are "coming from". For example:

I'm an amateur radio operator, so naturally to me, "wireline" is not radio at all and can hardly be considered as "competition".

No, when I see people attempting to replace radio links in our network with telephone (wireline) links, I don't think of competition at all. What I see is simple vandalism. - The process of destroying an amateur radio digital network to replace it with utter dependence upon non-ham communications.

Maybe Mike's "vision" of packet radio includes being a parasite hanging off of the back of the Internet, but many of us find that paltry vision to be unacceptable. We'd rather be proud, independent amateur radio operators, thank you. -- Like we always have been, prior to amateur TCP/IP.

> When are you going to wake up to the fact that you are being USED by
> Hank? Most everyone else eventually has seen through his game. Quit
> riding on his platform; you're only there because you're easily

> engaged and manipulated. Surely you're more perceptive than this.

If Mike started off as a ham, and evolved into a LandLine Lid, I'd say he was the one who was easily engaged and manipulated. Somebody told him that the telephone is a cheap, easy way to avoid the challenges inherent in being an amateur radio operator, and he went for it hook, line, and sinker.

Mike probably shares TAPR's networking expert Steve Stroh's contention that when you use Internet connections with a radio/TNC on either end, it's called "advanced amateur packet radio networking".

I call it "Amateur Telephone", which I find to be a more honest, accurate description.

It sure isn't amateur radio.

If you have questions or need assistance contact: k7on@qsl.net

---

bit bucket /n./

1. The universal data sink (originally, the mythical receptacle
used to catch bits when they fall off the end of a register
during a shift instruction). Discarded, lost, or destroyed data
is said to have `gone to the bit bucket'. On Unix, often used
for /dev/null. Sometimes amplified as `the Great Bit Bucket in
the Sky'.

2. The place where all lost mail and news messages eventually go.
The selection is performed according to Finagle's Law;
important mail is much more likely to end up in the bit bucket

than junk mail, which has an almost 100% probability of getting delivered. Routing to the bit bucket is automatically performed by mail-transfer agents, news systems, and the lower layers of the network.

3. The ideal location for all unwanted mail responses: "Flames about this article to the bit bucket." Such a request is guaranteed to overflow one's mailbox with flames.

4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bitbucket." Compare black hole.

This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box.

Another variant of this legend has it that, as a consequence of the `parity preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance.

>>> Part 1 of 2...

It's 15 Jun 97 09:20,
We'll return to glenq@NOSPAMcyberhighway.net and All's
discussion of What's wrong with Packet

gl> This brings me right back to my original question: For those of us
gl> with ready access to the Internet, what's the reason to use ham radio
gl> to connect to the 'net?

In the "usual" meaning of "connect", none. However, as has been pointed
out, what is wrong with using landlines as a way of linking widely
separated radio nets? In these networked days, there's less distinction
between the various communication services (phone, radio, TV, written
communication, LAN, etc). They are increasingly overlapping as time
goes by. As a few examples:

Data over TV - Teletext
Radio over data links - Real Audio
Data over cable TV - Cable Internet
Data over voice lines - The modems most of us are using
Telephone over radio - Cellular phones
LAN over Internet - Virtual Private Networking

The latter is essentially the same concept as an amateur radio wormhole
- a network that uses a WAN as a "carrier" to economically bridge long
distances. The main differences being (1) speed differences and (2)
VPNs use encryption, wormholes use plain text.

gl> Of course, on the other side of the coin, the anti-Internet folks have
gl> not answered my question about why those of us with functioning LANs
gl> and no connection to the rest of the ham net should not be allowed to
gl> use the Internet to move traffic to and from our LAN.

I am considering persuing this option. Recent experiments with packet
have been less than successful, due to location and lack of antenna
space. However, I could provide a useful link between certain low lying
areas in Melbourne's west and the rest of the packet network by setting
up a wormhole, as I fire directly into some low lying areas, and at the
same time, be the gateway for a geographically defined subnet.

gl> These are complex concepts, seems to me, and are not well served by
gl> namecalling and obfuscation. The simple, observable fact is that easy
gl> Internet access has a chilling effect on further development of the
gl> RADIO portion of the ham network, and it's only going to get worse as
gl> Internet access becomes more ubiquitous. It's not hard to imagine a

It can. However, there is always the other side of the coin - utilising that Internet connectivity as a springboard for new ideas. Some of the newer Internet technologies combined with digital radio techniques could lead into some interesting developments.

gl> scenario where ham packet will completely disappear, and a bit more
gl> imagination might suggest that even much of the voice portions of ham
gl> radio may wither as well.

Sadly this may be the case, but only for the lack of imagination of many amateurs, inertia and unwillingness to accept new ideas. Lets face it, the pursuits of many amateurs don't stir the souls of kids as they once did:

DXing - Anyone with a Net connection and the right software can "work the world"

CW - It's an interesting mode, and I used to dabble in it when I felt like a change (and stuck to a hand key at that), but I doubt many non-amateurs would be inspired to take it up. I see CW becoming more of a mode for those with special interest in the art. However, it won't die, and I believe it shouldn't.

Homebrew - Would be nice if there was more of it, but with all the commercial gear around and rising prices, most of the "hackers" have moved to the PC arena long ago, hacking either hardware or code. :-(There are many "appliance operators" these days...

"Ragchewing" - One can do the same on IRC, or a Net phone, if they want voice. Or simply pick up the telephone and talk away for 25c.

Technical discussion - Once a great feature of amateur radio, and worth a listen, even if you only had a scanner (I once spent many a night listening to good discussions on a scanner before getting my ticket, then joined in myself). You still hear some on various simplex frequencies, but you're more likely to run into good technical discussion on a ham mailing list these days.

Packet - Its chief limitation is its speed (or lack of it) on most nets. However, with the Internet raising awareness of data comms in the general public, the concept of data over the airwaves does get peoples' attention and stir many souls like CW and voice did in the past. Many people with PCs and modems are amazed when I say that I've sent data over the airwaves with a PC and a radio (these days, that's the total hardware! :)). Given reliable and affordable high speed packet hardware (with a home brew option - I'd go for that one!), and a bit of imagination, packet (or a derivative) could be a potential boost for amateur radio.

I also suspect that if data does become a big future of amateur radio,

>>> Part 2 of 2...

it will have huge implications for the regulations. Data is a fast
moving area, and the rate of change could easily create regulatory
headaches. I suspect regulations would become less "specific" and
concentrate on intent of communications and activities, rather than
actual content or technical details (outside of spectral purity and
interference concerns).

It's 14 Jun 97 23:55,
We'll return to ke4zv@bellsouth.net and All's
discussion of What's wrong with Packet

ke> We've been using 56 kb here since 1987. It works, it's practical, and
ke> we've built a network using it. But we're an island in a sea of 1200
ke> and 300 baud interties. There are a few other similar islands around
ke> the world where high performance packet radio is being practiced. But
ke> we have no practical way to tie them into a coherent network by radio.
ke> That makes our amateur efforts far less useful and interesting than
ke> they could be.

I've considered getting a group down here to experiment with 56k packet
technology, mainly (1) to give amateur radio here a shot in the arm, and
(2) to look at the possibilities of applying modern Internet style
technologies and applications to a radio environment. (and nearly purely
radio environment due to legal limitations here).

Do you have any pointers to info on 56k - the technology, prices and
availability, and of course, FAQs any any other relevant technical or
non-technical information. Comments from current users would be
appreciated too.

ke> Those who are fighting the use of wireline interties are really
ke> fighting against the growth of high performance amateur packet radio.
ke> One complements the other, and both are needed to bring us out of the
ke> stone age. As long as our network performance limits us to only a few
ke> trivial applications done by only a few people at a time, packet won't
ke> attract the critical mass needed to break it out of the limiting
ke> paradigm in which it is currently mired.

I tend to agree. I see the use of the Internet as a high speed
(sometimes you wonder these days! <grin>), reliable link between radio
nets. It is technically difficult to achieve any real speed via HF, and
satellite technology would be the only other pure radio possibility. As
an observation, it's worth noing the advantages that combining radio and
landline have for mobile phones. Why can't we be as innovative?

... Someone's dogma keeps chasing my karma

I haven't been following all the discussion, but the way the 44net nodes are tied together, is with a big routing file we attach at boot. An encap table which has all the routes to other nodes and their subnets. So I don't actually route my packets back to mirrorshades, but mirrorshades shows up in your traceroute to get to me. I tunnel my 44net packets directly to the other node.

Mike is a Lockout Lid. That's really all you need to know about him.
There's lots more, but I don't really feel like dredging it all up,
although I admit it would be amusing. The fact that he's still got a
hard-on for me several years after all this crap took place should
tell you something. I had to look up his name in the callbook to even
remember who he was; that's how significant he is to me.

>> When are you going to wake up to the fact that you are being USED by
>> Hank? Most everyone else eventually has seen through his game. Quit

I'm not being used by anyone, Mike. If you'd use the brain ghod gave
you, you might realize this. Of course, you were used by some folks,
too, but that's not my problem.

>> riding on his platform; you're only there because you're easily

Call for Papers

1997 ARRL and TAPR Digital Communications Conference
October 10-12, 1997
Baltimore, Maryland (minutes from BWI airport)

Web: http://www.tapr.org/dcc

It's that time again! Time to mark your calendar and think about what to publish for the upcoming 16th Annual ARRL and TAPR Digital Communications Conference.

The 1997 ARRL and TAPR Digital Communications Conference will be held October 10-12, 1997 in Baltimore, Maryland. This year's conference location is just minutes away from the BWI (Baltimore/Washington International) Airport.

For full details on the conference see http://www.tapr.org/dcc or contact the TAPR office for the DCC information flyer.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by August 20th, 1997, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to lweinberg@arrl.org. Information on paper submission guidelines are available on-line (http://www.tapr.org/dcc) or can be mailed.

Contact TAPR to register of for more information on the DCC.

>together, what incentive is there to develop new radio links and
>expand/improve old ones?

What I've been trying to tell you is that there is no real RF WAN
now, and no realistic chance that amateurs can develop one in the
near future. So the only two real choices we have is to leave our
LANs disjoint or to make use of the wirelines to internet them.
Leaving them disjoint severely limits what we can do with packet,
and is thus harmful to the expansion and development of amateur
radio packet.

>Now that the Internet is available at low
>cost to almost all of the USA, why would anyone spend thousands of
>dollars to build a high-speed ham LAN when each ham already has or can
>easily get an Internet connection? If the 'net had been available
>here when we started building our LAN, I doubt very much if we'd have
>done it. I just don't see any practical way you can mix ham radio and
>commercial "wirelines" and not have ham radio suffer.

That's where you are completely missing the boat. The only place
where we can beat the wirelines is at the local loop. We can beat

dialup performance, and we can operate mobile or portable if we like.
We can't get that from the wireline providers. So there is real utility
to doing our own LANs and MANs.

Since we're primarily doing packet for the fun of it, though it holds
educational and emergency preparedness value too. we don't have
to justify it in any other way than that we enjoy doing it. But it does
help if what we do is something we can do well. We can do LANs
and MANs well. We can't do a WAN well, in fact for the most part
we can't do one at all.

Of course it costs more to do it ourselves. I can get a 28.8 kb dialup for
$20 a month from most ISPs. To equip myself to do 56 kb amateur RF
networking costs nearly $1,000. Breakeven doesn't occur for at least 4
years. But that argument could be used about anything we do in amateur
radio. A free cellphone and 20 cents a minute is cheaper than a VHF rig
that can access an autopatch and monthly repeater dues. Long distance
at 10 cents a minute beats a $3,000 HF rig. Etc. To some extent, we do
things in amateur radio because we want to, not because they make
economic sense.

I want to do high performance LANs and MANs. I can do them, and I can
do them well. Therefore I choose to do so. I'd like to do a global WAN too,
but I can't really do it, and I certainly can't do it well (for a number of technical,
financial, and political reasons which have already been well addressed), so I
make use of the services of the wireline providers to internetwork with other
amateur LANs and MANs. That makes sense. The local amateur LAN islands
are much more useful and interesting when they're internetworked with other
amateur LANs and MANs. That makes participating in them more attractive,
thus it boosts activity and interest among amateurs. Using the wireline
services for WAN support enhances the efforts of amateurs in the local
LANs and MANs. It does not detract from those efforts.

I also choose to experiment with thin links at HF. I do that too because I want
to, and because it is interesting and challenging. But it would be the height of
folly and arrogance to demand that LANs and MANs depend on me for their
internetworking services. That's because I couldn't technically satisfy their
service needs. The pipe is too thin, and any network I could form would be too
sparse to support even one high performance LAN linkage. To demand that they
use my services exclusively *would* be harmful to amateur radio packet.

>
>Ken AC1H

All three are sources of channel impairments. The primary problem
in transmitters is introduction of the modulation into the PLL error
loop. This introduces amplitude and phase distortions to the low
frequency components of the modulation. The solution to this is
to introduce modulation in an IF stage outside of the PLL error
loop. Or use a crystal controlled transmitter.

The primary problem with receivers is differential phase errors in
the passband. This is primarily caused by the IF filter. A solution is
to use a wider filter because the phase error is most extreme near
the passband edges. This hurts CNR, however.

Path errors are the result of multipath, noise, and interference. Of these,
multipath is generally the most intractable. It will be different between any
given pair of stations. This is the major impediment to the use of equalization
in a multipoint system because the required equalization has to be different
for each station pair in the network.

Source record: 29122

Hi everybody!

I was hoping someone could help me locate a small packet TNC, something along the lines of the pocket packet TNC that Heathkit used to offer.

I'm trying to set up a portable packet station for hiking... I am using my HP 48 calculator as the terminal, which currently works with my MFJ multimode (a bit to bulky/heavy for packing) and a HTX202 handheld. Because I'm using a calculator as my terminal, I need something with it's own power (preferably 9v battery) as opposed to something powered off the serial port.

Any suggestions?

TIA
Jason Conolly, N7IME

The TNC needs to be in the KISS mode if you are using JNOS, and probably any
other NOS too. PCPAKRAT probably uses the TNC in the HOST mode.....

>glenq@cyberhighway.net
>WB7DOW @ KB7CFD.ID.USA.NOAM

Let me explain a way you can mix ham radio and commercial
wire lines and not have ham radio suffer. Last October, we had
two stations here on packet radio. One guy running a BBS,
with no bulletins, no forwarding, and one other guy who checked
into it once a month on VHF at 1200 buad. I got interested in
the DX clusters on the internet, and put a TCP/IP package together
to support a DX cluster node here. Since I already had the wireline
link set up to do the cluster, I offered to get some bulletins from the
US of A for the other BBS here. Now we have about seven stations
active on 1200 buad packet, we have a 1200 baud VHF/9600 baud
UHF cross band node, and a 9600 baud link between the two BBS
systems. We have another cross band node in the planning stage,
and we are talking to hams on another island about 120 miles away
about how to link to them (with RADIOS) to get them involved. We
have 8 people signed up to build 2 meter jpoles at field day, one ham
who just got a TNC who needs help hooking it up, and another ham
who is trying to get a Baycom modem working with an old computer.
I have more Baycom modems on order, and we are putting together
a loaner station (radio/TNC) for any of the new techs who want to try
packet RADIO and see if they like it before they buy thier own gear.

There is interest in packet RADIO again here because of the internet
wormhole, which supplies some content (bulletins) and the DX cluster.
There is interest in Saipan in packet RADIO because of what we are
doing here in Guam and there has never been anyone on packet in
Saipan. Nobody in Guam has ever been on 9600 buad packet (except
two of us on the satellites). (Yes, Gary, I know about 56kb RF modems
and I realize the speed of light is much faster than 9600 baud). (Yes,
Squiggy I know you think BBS's and DX clusters suck). The new
hams, mostly no code techs, are finding something to do besides talk on
the VHF repeater. The club is talking about using APRS for public service
work. Yes, I know about Clover.

Anyway, Glen, wirelines (the telephone, the internet) have helped me
create a way to get more people interested in and using packet RADIO.
Maybe it will grow to the point where there is enuff interest and enuff local

users to get us back on HF again and shut down the phone. In the 13 years I have been here, Hank is the first guy who offered to foward to me on HF with an antenna pointed in this direction.......

No, I don't think hams in California who are two miles apart should be forwarding bulletins via the telephone. But there are instances, like ours out here, where wire lines can be mixed with ham radio and not make ham radio suffer. To the contrary, when used properly, wire line connections can make packet radio grow......

Another example where the internet would grow packet radio is the Philippines, where they have been using a 300 baud HF packet BBS in Japan for years as the only link between one island and another. If they linked the islands together with wirelines, they could spend more time, effort, and what little money they have on radio LANS instead of beating their brains out all day on 300 baud HF packet forwarding thru a BBS in another country.

73, Jim KH2D

How clever... (Not)

Actually, in the situation Steve describes the BBS SYSOP's action is known as "providing a network resource". The BBS SYSOP can contribute to local NodeOps if he wants to, but is certainly under no obligation to. How many NodeOps, you may ask yourself, donated time and money to setting up the his BBS?
Fact is, setting up and operating a BBS typically involves much more of both time and money than setting up or operating a packet node. I do both, so perhaps I'm in a better position to judge these matters.
In fact, most packet nodes owe their existence to packet BBS stations in one way or another. Amateur Packet BBS stations have always been the primary driving force in the expansion of our packet radio network.
Contrast this to amateur TCP/IP , which through it's "Amateur Telephone" sickness has managed to slow and sometimes even reverse the packet radio net's growth.

If there is a "scum-bag" group in Amateur Radio today, my vote goes to the "Internet Forwarders", who are actively working to destroy the packet network which hams have struggled over ten years to build.

That, and "LandLine Lids" who through their ignorance insult their betters.

>is a red herring in this regard.

Exactly. Commercial comms have been reducing ham radio's
contributions to emergency comms for a long time now. Ham radio just
cannot compete with commercial carriers on a price/convenience basis,
for the most part. And now, the Internet is a major factor in gutting
the development of packet. For one thing, nobody "controls" the 'net,
so all the ham politics can be bypassed by using it.

>So why do folks do folks do ham radio (or other similar hobbies) at all? We

>who share that interest.

Of course, but it takes far more than that to develop a functional
packet network. As I've pointed out before, packet is nearly unique
in the hobby in that it requires cooperation and coordination among
large numbers of hams for it to work. Just reading this group for a
few days tells you how unlikely this is to ever happen.

> Right?)

Yep. So, since agreement is unlikely except in scattered areas, we seem doomed to small pockets of packet interconnected by wireline services. As apathy sets in and feuds develop, even those pockets may disappear. As commercial services become more available to "rural" areas, that incentive will tend to diminish, as well. You end up with only the "experimenter" incentive, which puts us right back where we started -- with no ham RF-based network.

But that stuff will get cheaper if there's a demand for it, as there seems to be.

> There are always benefits to having a redundant system for emergency
> comm.

True. If the RF alternative continues to shrink, we won't have that redundancy, will we?

>As a side note, I see nothing in the above that suggest that it is

Makes sense. We still have the "politics" problem, of course, plus the apathy once the new wears off of any new system.

You wouldn't believe how much trouble I had figuring out how the NetRom TTL parameter works. Most of the "experts" in the PNW area had no clue, and had it set at a ridiculously high value at most of the nodes. Some of the routing loops that developed were mindblowing. Once I figured out how it worked, then came the problem of convincing neighboring node ops to make adjustments. What a mess.

Of course. I can see this, and don't disagree with it in the least.
All I'm saying is that the wireline connections are going to tend to
gut the RF portion of packet in many, if not most, cases, for reasons
of ham politics if nothing else. Perhaps this is the future of ham
packet, and we should all start hooking up to the internet and let the
node/BBB network die -- the sooner the better, right, Carl? It seems
to me that using wirelines for basic ham functions is like being a
"little bit pregnant." It's going to grow on ya.

>>I've seen TCP/IP operating on ham packet. I was not impressed.
>
>That's probably because you've never seen it work over a competent
>RF infrastructure. And it may be because you've only seen it used in

Well, any method would work better in a "competent" structure. Even
NetRom could be improved immensely with some fairly simple changes,
even at low baud rates. Despite an almost constant drum-beat for
TCP/IP in packet for many years, I still don't see any of its
advocates (around here) doing anything at all about improving the RF
networks. In other places with lots of computer-literate hams, they
evidently have done some work along those lines. Maybe it's a
chicken/egg thing.

>a quasi-standalone manner on a primitive single tasking OS, in much
>the same fashion as amateur BBSs are typically used. When serving its

Well, BBSs were evidently developed to best utilize the hardware we
had at the time. It may be time to throw it away, as has been
suggested. That's going to leave a LOT of present users out of luck,
however.

>>None of this has anything to do with Radio vs. Landline.

>the area where communications are needed.

You could say the same about CBers and cellphone users, which
outnumber hams by a huge margin. The only advantage hams have is that
we are allowed to tinker and innovate with the hardware we use. Ham
participation in emergency comms has been steadily declining, it seems
to me. I guess this is mostly a sidebar to this topic, but all too
often I see "emergency" used for packet in much the same way it's used
by the pro-code folks. I think it's nearly as exaggerated in the
packet example as it is in the CW example. Most everyday emergencies
are handled by FM repeaters. Large scale emergencies are handled by
whatever means come to hand.

Short semi-relevant example here: Several years ago, there was a
serious forest fire situation here in Idaho, and hams were called out
to provide comms. Much of this was "morale" type stuff: firefighters
sending messages to the folks back home. There were also logistical
comms involved. We had a complete, self-contained packet node in a
sealed box ready to go. All that was required was to plug in an
antenna and a power supply. We offered this to the hams involved.
The forest service would have put it on a mountaintop with access to
the area packet net. It would have been a wonderful display of how
packet could provide accurate, fast, hard copy comms. You guessed it
-- the offer was declined. You can lead a ham to knowledge, but you
can't make him think. But I digress...

>BBSs are an *application* which can run on top of a internetworking protocol.
>Currently many amateur BBSs *don't* run on top of an internetworking protocol,

>radio" than tying an amateur voice repeater to the telephone system via a
>patch. Both are attempts at internetworking for the benefit of the amateur
>radio operator. In other words, they should be viewed as *augmenting* the
>communications services amateur radio can provide.

I think the difference is obvious. The phone patch interface is the
dog wagging the tail, and the packet/wireline interface is the tail
wagging the dog. More significant is that phone patches are mostly in
the ham tradition of individuals or small groups doing the innovating
and the work. Packet requires the cooperation of large groups of
contentious folks to make it work, and the Internet allows individuals
to bypass this requirement. The packet part of the equation is
inevitably going to fade away because of this fact, it seems to me.

>Attempting to "do it all" via amateur radio is doomed to failure. The resulting
>system won't be able to "do it all", and will be difficult or impossible to make
>interoperate quickly and seamlessly when called upon to do so. We need to
>look at amateur radio as just one facet of the total communications infrastructure.
>Our goal should be to design our systems in ways that allow them to seamlessly
>interoperate with those other systems, augment them, and to some extent replace
>them at need. We can't do it all, but we need to do our part.

What that part is and what it should be seems to be at the heart of
this argument. It certainly bears discussion and consideration. Most
of the most vocal people in this forum seem to have already made up
their minds, and don't even bother to present reasoned arguments for
their positions.

>We can, of course, continue to experiment with such thin nets (there are some interesting
>things we can try at HF, and with satellites), but we should be smart enough to realize
>that they are, and will continue to be, too thin to meet the needs of internetworking the

Perhaps our "needs" need to be redefined, then. One can do a hell of
a lot of "impossible" things if you don't care who gets the credit,
but just go ahead and Do It.

>amateur radio LANs and MANs which we *can* do well. If we don't use the facilities
>offered to us by the wireline providers to internetwork those LANs and MANs, we will
>severely limit and shortchange what we can accomplish.

Once again, that depends on *what* we want to accomplish.

Actually, the commercial applications are rather limited and costly at this
time ... RAM Mobile data is, I believe 9600, and ARDIS is, I believe 4800,
and CDPD would max at 19.2kbps ... and you pay *by the packet* ... which
can add up to LOTs of money ... amateur packet could still lead the way
in some aspects of technology development, were it not for folks like Hank
and Charlie who want to insist that everyone stay in the 1970s with their
dumb-terminal-login/BBS-forwarding paradigm ...

I'm just a person that knows a little about networking. Bits are
bits, and wireline vs. wireless is just a set of tradeoffs. Obviously,
someone interested only in finding way to move data may consider
a wired network as an alternative to a wireless network. Each class
of network has a particular set of advantages and disadvantages.

Sometimes, even for a radio amateur, the advantages of a wired network
may dominate and the intelligent thing to do is use a wired network.

In other cases, the advantages of a wireless network dominate and the
intelligent thing to do is use a wireless network - even when not a
radio amateur.

An evolving network can certainly be built using both classes of
technology. So what? Hams have run phone patches for decades, as
well as deliver NTS messages via the telephone. We use the means that
make sense.

>No, when I see people attempting to replace radio links in our network with
>telephone (wireline) links, I don't think of competition at all. What I see
>is simple vandalism. - The process of destroying an amateur radio digital
>network to replace it with utter dependence upon non-ham communications.

Oh, you're worried that the inadequate radio network will fall into disuse
as people flock to wired networks. If the radio network was offering an
advantage, this wouldn't happen. So, you're preaching against using
landline network facilities rather than doing something positive to improve
the radio facilities. Do you have some kind of 1Mb/s+ radios you're
developing for free and selling kits at cost? Do you have anything to
offer other than sermons?

>Maybe Mike's "vision" of packet radio includes being a parasite hanging off
>of the back of the Internet, but many of us find that paltry vision to be
>unacceptable. We'd rather be proud, independent amateur radio operators,
>thank you. -- Like we always have been, prior to amateur TCP/IP.

Well, that's exciting. If you feel so strongly, why don't you take a
few moments to get started making technology available to radio amateurs
that allows us to build a network that provides real advantages over
the wired network. Maybe after you do this for a while you'll start
to appreciate why wired networks are connected to wireless networks.
Perhaps your sermons will even start to reflect a sense of reality rather
than religion.

[...]

>If Mike started off as a ham, and evolved into a LandLine Lid, I'd say he
>was the one who was easily engaged and manipulated. Somebody told him that
>the telephone is a cheap, easy way to avoid the challenges inherent in
>being an amateur radio operator, and he went for it hook, line, and sinker.

"LandLine Lid"? That sounds like a generic ad hom attack, not a cerebral
comment. Sure, the telephone is a fairly cheap, easy way to transport
data. Radio can have some advantages, but a wireless network without these
advantages is not appealing when compared to those telephones. The problem
is not that telephones are available - it is that the amateur radio networking
technology has stagnated and you're telling people to use the old technology.
What can you do to actually make newer technology available - rather than
scream at people that refuse to use the old technology.

>Mike probably shares TAPR's networking expert Steve Stroh's contention that
>when you use Internet connections with a radio/TNC on either end, it's
>called "advanced amateur packet radio networking".

I didn't know TAPR had a single networking expert. With all respect, I
question your judgement in selecting networking experts, anyway.

>I call it "Amateur Telephone", which I find to be a more honest, accurate
>description.
>
>It sure isn't amateur radio.

So you say. What's your point? That no one should interconnect wired
and wireless network technologies? That's nothing but a religious
viewpoint in what should be a technical discussion.

Rather than preaching, offer alternatives.

Anyone have any experiance with the FlexNet software?
How easy was it to set up?
How are you using it?
Are you using a TNC or a Soundcard or what?
Are you just using it to get into other nodes or have you set up a
server?
TCP/IP?

Inquiring minds want to know!

In other words...I'm interested in trying it.

>>I got into packet radio in about 1980 with 1200 bps and a TNC .
>
>Hmm... packet started in 1984 ?

Hardly. DARPA started work on the ALOHA net in 1968 and was operational
by 1970. Amateurs started doing packet in the mid-70s, though that was strictly
experimental stuff (we were doing packet locally with Bell 103 tones and our own
kludge protocol in 1976). In 1978 the Vancouver protocol was introduced and that
standardization really got the ball rolling. GLB came out with the PK-1 TNC (about
$100) which allowed any amateur with a terminal to do packet. TNC stands for
Terminal Node Controller, we didn't need computers for early packet. A bit later,
TAPR rolled out the TNC-1, and shortly thereafter the TNC-2, which remains the
benchmark TNC to this day. A meeting between TAPR and AMSAT hammered out
a new protocol, AX25, and we were off to the races for sure.

>And in 1980 1200bps modems were like 56.4K are today, the cutting edge.

Yep, 1200 baud was hot stuff using Bell 212 dialup, but amateurs were using old
Bell 202 half-duplex leased line technology, and that was over 10 years old at the
time. In fact Bell 202 was chosen because a whole bunch of those modems had
shown up on the surplus market because the leased line folks were moving to
4800 baud in the mid-70s.

>Most people didn't even know what a computer was in 1980. Those who did,
>thought they looked something like ENIAC or at best, the big box with 1000's
>of LED's and voice synth they saw on "Wonder Woman" !!!
> Your average Z-80 system then Cost about $5000, 16K of RAM cost $200.

Remember that IBM was rolling out the PC by 1981, but we already had the Apple II,
the TRS80, and a host of S100 based CP/M machines in the latter part of the 70s. My
first machine was a Processor Technology SOL, back in late 1975. It cost $995 including
keyboard and video. With 48k of RAM installed, it supported the Northstar disk OS and
Northstar Basic. With 16k installed, it supported cassette Basic (cassette IO was built
in).
It sported two serial ports and a parallel port standard, just as PCs today do.

Cromemco was a big name in S100 systems back then. They even offered an OS called
Cromix, which was a Unix clone for the Z80, on their Z2 machines. My second S100 machine
had dual processors (Z80 and 8086) and a multitasking OS which allowed CP/M86 and
CP/M 2.2 programs to run concurrently. It used the Morrow Discus dual 8 inch floppy disk

system, 600k each. All up cost was about $2,000, including 256k of *static* RAM. That machine
made the IBM PC look sick when the latter came out a couple of years later with only 64 kb of
dynamic RAM and cassette IO. It soon added disk support (dinky 5.25 inch 180k) and the first
Microsoft virus, err OS. The rest is history.

>I'd dread to think how much it cost to build a TNC then taking into account
>monetry factors.

GLB did it for about $100 (kit). The TNC-2 was under $200. Both were Z80
based. The GLB was a bit banger (software USART) while the TNC-2 has
a hardware SIO chip.

>>I got out of packet radio about 10 years later simply because of the fact that

>>past them .
>
> In 1990 the fastest phone modem was 4800bps.. most people had 2400 and
>rumours of 9600 were getting about.

Half duplex leased line modems were running at up to 38.4 kb, and the hot dialup
modem was the Telebit Trailblazer, offering 19.2 kb quasi-duplex in PEP mode in
1990. But (some) amateurs had been using the 56 kb WA4DSY RF modem since
1987 when it was introduced (yes, it has been in operational use for 10 years).
Most amateurs remained, as they still do today, at 1200 baud using Bell 202, a
technology which was obsolescent on leased lines in 1975.

Today, the SOTA in dialup is bonded ISDN at 128 kb. But (some) amateurs have the
1.2 Mb Slovenian radios in use. (Some) amateurs have consistently been ahead of
the telco local loop since the beginning. All amateurs could have been if they weren't
fixated on the idea of dual use of FM voice radios.

Alrighty then, you may be ready for a tcp and sfs compromise idea of mine. I'm sure it will not satisfy all of the anti-TCPIP crowd here but it just may make a few think. How about if each LAN or MAN had a SMTP server setup like this . . . it routed all mail that everyone chooses to do so, over the HF long haul store and forward systems (actually it could route all email to a the long range net controller where he/she could forward it by hand, or whatever they choose). However, it would also be up to the people who are sending mail, whether they would like to have it sent over the HF/2m systems or whether they would like to pass over the fiber connections. This fiber option would insure safe travel for emergency traffic (I myself think that this is extremely important, others opinions may differ) across fiber, and old sfs email under normal circumstances. The fiber would also always be used for any other traffic that falls outside of the scope of email, such as html or live long range tcpip chat, so that speed and efficiency is kept where it needs to be. Keeping the long range sfs's as a part of a TCPIP MAN/LAN would insure that funding would continue to be provided for the long haul sfs's that some choose to participate solely in, while continuing to fuel the fast action on tcpip. The compromise, if moved in the correct direction by the administrators, would also have the effect of slowly moving the long range networks to high speed, at which point they could also be moved to tcpip. The networks would be as thin as the long range sfs's are now, but the system would by that time be evolved to the point it could fall back on fiber transparently, alerting those in charge of fixing the rf links to the problems at hand.

Comments? Suggestions? (all blatant flames auto routed to c:\temp\?.tmp and summarily deleted as such)

It's 14 Jun 97 05:41,
We'll return to hank_oredson@mentorg.com and All's
discussion of [1/2] What's wrong with Packet

ha> Wow! Must be a REALLY small apartment if you can't fit a 70 cm
ha> antenna ...

Oh, I have one up. It's just that the only station within listening
range is at the limit of transmitting range, and it's almost impossible
to get a signal into it. :-(It's on the far side of town, just outside
my ideal direction. As for the antenna, it's about a dead short at 2m,
so no dice there. :-(

... Teacher = Person attempting to civilize youth. See crazy.

Charlie ... listen carefully ... THERE IS NO "AMATEUR RADIO DIGITAL
NETWORK" OF THE SORT TO WHICH YOU ALLUDE ... IT DOESN'T
EXIST ... a cobbled together collection of antique BBS applications
trying vainly to talk to each other over hopelessly unreliable radio links
with holes all over the place does NOT deserve the title "network."

As was suggested, when you have something of value to contribute
or some useful level of service to offer, then you can speak with some
relevance ... so far, you're just a nutcase who clearly doesn't know
what the hell he's talking about ...

Either the pico packet from PacCom, or the KPC-3 or KPC-3+ from
Kantronics seem to fill most of your requirements. Ads for both abound,
and you can find partisans for both. Both work, and both seem to be what
you want.

Of course you can. I can get a microwave T-1 connection from my ISP
right now at a fairly reasonable price. It's a shared system, of
course, but it's bound to beat any wireline connection in terms of
bits/dollar. Mobile connections are or will be available at
reasonable prices if demand is there.

>Of course it costs more to do it ourselves. I can get a 28.8 kb dialup for

>economic sense.

Of course. I might point out that we often also do things *less
efficiently* than commercial applications for the same reasons. You
can't have it both ways, Gary. Either we do it on RF for traditional
ham reasons, or we do it on wireline for speed, price, and
convenience. Or we mix them, and rationalize why we're doing it.
It's not unlike DXers who use lists, Packet Cluster, etc, to help make
more contacts, thereby removing a lot of the fun and challenge of what
made DXing a part of the hobby in the first place.

>amateur LANs and MANs. That makes sense. The local amateur LAN islands

Perhaps. I don't think that's been demonstrated as a universal or
lasting TRVTH, however.

>I also choose to experiment with thin links at HF. I do that too because I want

>sparse to support even one high performance LAN linkage. To demand that they
>use my services exclusively *would* be harmful to amateur radio packet.

I don't know that anybody's doing that. RF folks want packet to use
existing RF links, I understand, but I'd prefer to let them make their
own arguments. You've certainly made better arguments for your case
than most of what I've seen for the opposing side, at least in this
forum where we can get quick feedback from both sides. Most of what
I've seen so far from the RF advocates has been on the BBS system, and
has gone largely unrefuted by anyone with rational arguments.

We still talk "techie" on our 220 and 440 machines here, although not
as much as we used to. A lot of it is computer related nowadays, of
course. Local repeaters are a great way to help new people get hooked
up to a packet system and BBS, and show them how to work it, too.

Well, yeah, I can see where this might be a big help in isolated areas
and Third World countries. I'm thinking mostly of the USA and other
areas with relatively concentrated populations.

>No, I don't think hams in California who are two miles apart should be
>forwarding bulletins via the telephone. But there are instances, like ours out
>here, where wire lines can be mixed with ham radio and not make ham radio
>suffer. To the contrary, when used properly, wire line connections can make
>packet radio grow......

For now, yes. What will happen when the Internet and other non-ham
comms become even more accessible than they are now is what I'm
wondering about. I suppose the answer is to re-define what we want
ham packet to be and to do, and why. For that matter, ham radio
itself is in grave danger of becoming extinct without some re-thinking
of its role in the communications community. The hobby is becoming
more irrelevant by the day.

>Another example where the internet would grow packet radio is the Philippines,
>where they have been using a 300 baud HF packet BBS in Japan for years as
>the only link between one island and another. If they linked the islands
>together with wirelines, they could spend more time, effort, and what little
>money they have on radio LANS instead of beating their brains out all day on 300
>baud HF packet forwarding thru a BBS in another country.

With some rule changes, tech solutions, and political arm-twisting, HF
could play a major role in HF packet's future, it seems to me. There
certainly was a pretty good HF network in place a few years ago, if
the foreign packets I saw routed through our BBS was any indication.
We've gone backwards in that area, it seems to me. Anybody got

evidence to the contrary?

: I'm a member of PI4CC contest club and we are struggeling with a smal
: "packet" networkproblem.

: We are using several contest logging programs which supports serial
: networks, but we want a remote link with the network.

: In the datastrings over the SERIAL network the programs use control
: caracters, which are filtered out using a TNC (ore other standalone packet
: modems) in CONVERSE mode.
: In the TRANSPARENT mode the filtering does not exist and a point to point
: link can be made, we tested it and it works fine.

: BUT we want to go beyond a single user remote connection.

Hi,

I was thinking of a way to make an internet wormhole and this may be
the way to go for your application too:

Since KISS mode is a simple protocol between the TNC and the computer, where
the data is already formated in pakcets, why not write a small program that
sits on a serial port and reads a packet from the TNC. It then outputs the
same packet on another serial port. The computer running the packet
switch, tnc emulation or bbs, reads the data from the second serial port
and answers it. The computer picks this up and relays it.

The program would be very simple and could run on almost anything.

Now if we add enough logic to the program to make sure the TNC is in
KISS mode we have a working system limited by the connection length of
the serial ports.

If we were to add some autodial and autoanswer code and run the programs
on two computers we could link the system with modems and a phone line,
microwave or light link.

Adding a quick TCPIP stream driver would allow us to use the internet.
This would be best accomplished under UNIX (or similar) as the serial
drivers, TCP/IP software, etc is already provided. This could run on an
old 386 with 8 meg ram and a small (100 meg) hard drive.

I was looking at this as a way of having a packet station in the U.S. while
I was physicaly located in Israel.

If one was really slick, you could write a packet driver for the unix version
of Phil Karn's (KA9Q) tcp/ip software that read directly from the other

side of the link. Then you could run a "super" PBBS with TCP/IP support,
connected throughout the world.

Geoff.

Actually it started in 1978 in canada with a kit produced by a guy called Doug Lockhart,called a TNC plus, ran a protocol called V2.
The TNC kit cost me $350 .
I got one of these kits in 1980 and had it connected to a Ferguson Z80 based Big Board computer running CP/M which I still have.
It didnt cost me $5000 but approx $570 dollars for the kit which was good value.
Packet Radio using AX25 and TNC1 s started in the US in 1984.

I am using it for 1200baud packet with a soundblaster compatible.
My experiance of packet was just playing with the tynmouth clubs
terminal and TNC setup. It took me several days to make up the
cables and the one transistor interface and get it configured properly.
The documention is not very good.
I trawled the shareware archives and grabbed about 20 packet programs.
Half of them insisted on talking to a physical serial port so
won't even work with the TNC emulator. I have settled on Superpacket.
I have also got it running with TPK (too complicated) and baycom
terminal.
I spend most time getting it configured properly.
I have a beta vertion of the soundcard driver, vertion 0.8 I think.
The machine locks up every few hours. I think there is a later vertion
but it got mangled in downloading, I'l try agian sometime.

I am just using it to connect to a local bbs and read messages,
1200 baud is stupidly slow even when I have the channel to myself at
4AM. I am going to have a go at 9600 sometime.

I gather it has some sort of adanced routing capability but the
flexnet team don't seem to want to tell anyone how to use it.
Don't expect a reply from them.

> In other words...I'm interested in trying it.You can download it and try it, the
soundcard drivers are
at http://www.ife.ee.ethz.ch/~sailer/pcf/pcfindex.html
There is a link to the main flexnet page from there.

The soundcard drivers don't work with windows. Pkunzip
dosn't work if they are loaded either unless you tell pkunzip
not to use 32bit instructions. I thinks its somthing to do with
the soundcard drivers constantly using the copro.

There is a win95 vertion out. It looks tricky to set up. Windows 95
is self inflicted, I don't use it.

The idea behind flexnet seems to be that front end programs
like super packet can talk to the hardware in the same way through

flexnet no matter if the hardware is a TNC, a baycomm or a soundcard.

Using flexnet I got on packet for a few pounds worth of plugs and sockets, a resistor, a diode and a transistor. The alternative was 25 pounds for a baycomm plus leads or 100+ for a tnc.

they ask for donations. I will send they some money when I can be bothered to get some money changed into deutchmarks. I have lost money sending cash in international postage but international bank transfers are awful.
Adam M0AMD

That's where you are wrong. The commercial mobile systems are outrageously expensive per byte, and are slow to boot. We can beat them, and do, just as we can and do beat the local dialup loop.

I agree that amateurs should go mobile (I am currently working on a point and click solution to this problem), and its somewhere we can excel, however, I am not sure that auto rerouting (no broken pipes) will be possible anytime soon. It would seem to me that it would require a whole new level of bandwidth, to carry all of the messages that would be generated each time a person switches access points. However given more bandwidth and some slick hardware, you could have software that measures signal strength, keeps a list of active access points made from probes, and automatically shifts to different access points as you drive around. If scope was limited, it could work effeciently. If pipes did not have to be maintained (they don't under any browser or email software, unless a transaction is currently in progress), bandwidth need would be reduced by allowing the software to just obtain new IP numbers as your car moved along, and returning old numbers before going out of range.

ICOM Mailing List (and others)...

Icom is a mailing list (reflector) devoted entirely
to equipment manufactured and distributed by Icom
America, Inc. of Bellevue, WA.

* equipment, accessories
* repairs, modifications, enhancements
* questions, discussions, etc
* buy, sell, trade, swap

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe icom

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe icom

To post items to the reflector, send email as follows:
TO: icom@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

---

Kenwood is a mailing list (reflector) devoted entirely
to equipment manufactured by the Kenwood Communications
Corporation (Amateur Radio Products Group).

* equipment, accessories
* repairs, modifications, enhancements
* questions, discussions, etc
* buy, sell, trade, swap

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe kenwood

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe kenwood

To post items to the reflector, send email as follows:
TO: kenwood@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

-----

HomeBrew is a mailing list (reflector) devoted to amateur radio
and electronics experimentation and construction:

* building kits
* scratch construction
* radios, antennas, widgets
* design
* accessories
* station construction
* digital, analog, uP
* repair, modification, surplus

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe homebrew

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe homebrew

To post items to the reflector, send email as follows:
TO: homebrew@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

-----

Ham-Books is a mailing list (reflector) devoted to the literature
and periodicals of amateur radio:

* publishers
* magazines
* newsletters
* books
* old and "collector" books
* new book announcements

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe ham-books

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net

SUBJECT:
BODY: unsubscribe ham-software

To post items to the reflector, send email as follows:
TO: ham-software@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

---

Fox_Tango is a mailing list (reflector) devoted entirely
to "vintage" and "classic" equipment manufactured by the
Yaesu Musen Co., Ltd. of Tokyo Japan.

* equipment, accessories
* collecting, restoring, refurbishing
* buy, sell, trade, swap
* repairs, modifications, enhancements
* questions, discussions, etc
* just plain operating old Yaesu stuff

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe fox_tango

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe fox_tango

To post items to the reflector, send email as follows:

If you have questions or need assistance contact: k7on@qsl.net

---

Mobile-Portable is a mailing list (reflector) devoted to mobile
and portable operation of amateur radio (QRP and QRO, HF and VHF+):

* rigs, antennas, tuners
* installation
* batteries
* generators
* solar and alternative energy
* camping/RVs/backpacking
* laptop/palmtop computers
* portable packet
* roving and mountain-topping
* GPS, APRS

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe mobile-portable

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe mobile-portable

To post items to the reflector, send email as follows:
TO: mobile-portable@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

---

BitBucket is a mailing list (reflector) devoted to
specialized amateur radio communication techniques.

-SSTV, ATV, FAX, APT, DSP, QRP, APRS
-Packet, Pactor, GTOR, Clover, AMTOR, RTTY
-R/C, Telemetry, Balloons, Rockets, Robotics
-homebrew, modifications, interfacing, widgets, etc

To subscribe:

If you have questions or need assistance contact: k7on@qsl.net

---

bit bucket /n./

1. The universal data sink (originally, the mythical receptacle used to catch bits when they fall off the end of a register during a shift instruction). Discarded, lost, or destroyed data is said to have `gone to the bit bucket'. On Unix, often used for /dev/null. Sometimes amplified as `the Great Bit Bucket in the Sky'.

2. The place where all lost mail and news messages eventually go. The selection is performed according to Finagle's Law; important mail is much more likely to end up in the bit bucket than junk mail, which has an almost 100% probability of getting delivered. Routing to the bit bucket is automatically performed by mail-transfer agents, news systems, and the lower layers of the network.

3. The ideal location for all unwanted mail responses: "Flames about this article to the bit bucket." Such a request is guaranteed to overflow one's mailbox with flames.

4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bitbucket." Compare black hole.

This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box.

Another variant of this legend has it that, as a consequence of the `parity preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance.

Funny, I use that non-existant network daily.
Communicate with people all over the world.
Via radio.

Have you ever used it?

A quick check of my system logs did not show any evidence you
have actually tried to use the network you claim does not exist.

Heck Bill ... was able to telnet to your system on 40M ...

But this "Sampson" person does not think radio exists ...

I don't think he exists. A quick check of the system logs
verified his non-existence ... there is no evidence he has
ever used packet radio. But what the heck, he sure knows
all about it! Maybe some day he will try it out ...

In relattion to this thread, I just wondered whether anyone has done any work on direct Ethernet to Radio Modems, ie take the 10 mbit/s output of a stock standard Ethernet card and modulate the contents onto an RF carrier to achieve a simple radio based ethernet.
Obviously you would use a heap of bandwidth doing this simply but it should work.
I am interested in what modulation schemes are used and what mechanisms used to detect packet collisions ,(obviously CSMA/CD) doesnt work in a radio environment.
Whilst commercial Wireless Lan cards effectively do this ,they are still to expensive for normal amateur use and probably over complex , in that amateurs really dont need to use at this stage anyway DSS technology.

cheers

Bingo! We have to do it that way, or we risk carrying unvetted non-amateur traffic on the radio portions of the network, and third party rules don't allow that. Because we have administrative control of net 44, we can be assured that traffic originating from a net 44 site will be amateur traffic, and thus Ok for us to allow on the radio portions of the network. To access other parts of the internet, we have to use gateway (or firewall) stations which will vet the traffic for us. Thus net 44 is a big virtual network running over the internet. This is similar to how some other Class A networks are handled.

After surfing the net, I read that Baycom is no longer allowed to be distributed by network. The Baycom documentation states that you are allowed to make a copy from another ham as long as it is not posted on a net or distributed by a company.

So how do you get a copy?

Try Timewave, which now has the rights to the AEA packet equipment, and see if they're willing to sell you an upgrade to a more recent version of the
PK232. Not only are you likely to get something that will work if they are willing, but you don't have to worry about infringing someone's copyright!

That just goes to show how fucked up your software really is.

Check your logs back in 90 and 91. Maybe you can find my NTS messages no one ever sent. I was in Portland for 2 weeks every year from 1989 - 1993. Even had a mobile TCP/IP in my Buick (170 Watts) that made a Netrom broadcast for the heathen. I know people in Idaho saw it, as they used it all night while my car was in the motel parking lot in Idaho Falls... During the Iraq war I sent a TCP/IP message from Eskan, to Riyadh to Tinker, to an OKC BBS where it was sent NTS to Portland and it was never received. I had to resort to free land-line from AT&T to talk to home port. Hams couldn't/wouldn't handle the traffic.

1991 was when I lost all interest in BBS. It was a non-entity then, it remains one today. Really fucked up software...

The only radio I have now is a 19.2 kbps simplex, and a 9.6 kbps on the local repeater. You'll have to get to me via WB5CQU or 44net.

Perhaps if you'd use a real newsreader instead of that MicroSnarf Web
Browser, you could avoid such mistakes.

3504. EARN MONEY EASILY !!! (For Smart Guy/Gal)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-19 00:00:00 UTC
From: james@nowhere.com
Message-ID: <james-1906971701470001@ip-52-41.dialup.hkstar.com>
Source record: 29266
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment

Please spend a minute to read this, you may get a few thousands US dollars at least. It really works to anyone who follow those simple instructions. The guy who set up this is a smart guy, but who believe this and follow all is the smartest.

If you are a very smart guy or gal, please spend 5 more minutes to read the rest. Think very carefully and excute. My friend, a lot of money will flow into your pocket very soon.

- James

The original news I have received :

This is the fairest, most honest way I have seen to share in the wealth of the world!

Take five minutes to read this and it WILL change your life. If you want to know how to make thousands of dollars quickly, legally and with NO CATCH, then keep reading.

The Internet has grown tremendously. It doubles in size every 4 months. Think about it. You see those 'Make Money Fast' post more and more. That's ... because it WORKS! So I thought, all those users might make it work. And I decided to try it out a few months ago. Besides, what's $5.00, I spend more than that in the morning on my way to work on coffee and cigarettes for the day. So I sent in my money and posted.

A lot of users will join in and make it work for you.

Well, two weeks later, I began receiving money in the mail! I couldn't believe it! At first only a few hundred dollars, then a week later, a couple of thousand, then BOOM! By the end of the fourth week, I had received nearly $47,000.00. It came from all over the world. Every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still have enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking a similar chance with $5 of my own. Not a big chance, I admit--but one with incredible potential, because $5

is all anyone ever invests in this system. Period. That's all Markus, Dave, or Dan invested, yet their $5 netted them tens of thousands of dollars each, in a safe, legal, completely legitimate way. Here's how it works in 3 easy steps:

STEP (1)
Invest your $5 by writing your name and address on five separate pieces of paper along with the words: "Please add me to your mailing list." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them to the following five addresses:

1) S. Hogan
36 Prenton Lane
Prenton, Wirral
Merseyside, L42 8LB
England, Europe

2) J. Larsen
Grinnekaerrsvaegen 50
436 56 Hovas
Sweden, Europe

3) C. Mason
473 44th Ct. NW
Rochester
MN 55901-6666

4) H. Reichel
Hahnenstrasse 8
30167 Hannover
Germany, Europe

5) J. Yung
Flat C, 6/F., Tower 2,
Kornville, 38 Yau Man St.,
Quarry Bay,
Hong Kong.

STEP (2)
Now remove the #1 name from the list, and move the other names up. This way, #5 becomes #4 and so on. Put your name in as the fifth one on the list.

STEP (3)
Post the article to at least 200 news groups. There are at least 20000 news groups at any give moment in time. The more groups you post to, the more people will see your article and send you cash! It's recommended that you do AT LEAST 200 news groups for a lot of people to read it!

STEP (4)
You are now in business for yourself, and should start seeing

returns within 7 to 14 days. Remember, the Internet is new and huge. There's no way you can lose.

****

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses. Yes, that's right, only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4 ... $50.00 in your pocket!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average return, 500 people =$500.

They make 250 postings each with your name at #2 =100,000 postings =5000 returns at $1 each =$5000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list. And that's only if everyone down the line makes only 250 postings each! Your total income for this one cycle is about $55,000.

From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

The end result depends on YOU. You must follow through and re-post this article everywhere you can think of. The more postings you make, the more cash ends up in your mailbox. It's too easy and too cheap to pass up!!!

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who needs the money and see what happens.

GENERAL STEPS ON AUTOMATING THE PROCESS:

Make any necessary changes to this article as explained in step (2) and when you're satisfied, save it as a .txt file and import it into the body of your email or news reader program. This way you only have to change the name of the news group or email address for each redistribution.

Valuable tip: And very important for those not too familiar with email: By all means use a word processor to ensure the article is composed well, but to ensure people that first read it via their news reader program see it clearly laid out. Re-format it with a simple text editor such as "notepad," or "WordPad" if you're using "Windows 95." Providing the text is clearly visible and does not

scroll into the right margin, it should be okay! Using this procedure essentially means the article will be correctly displayed when viewed through other people's news reader. You can of course check this out for yourself before going on line, by viewing it in your own news reader program.

Next, begin by locating the news groups you intend posting to, Netscape 3.0 or a similar news reader is terrific for this, because you can highlight dozens of news groups all at once, enabling you to distribute your article to 1000's of locations in less than an hour or two. Highlight all news groups you want to mail your letter to (which as you know is done by holding down CTRL while left clicking.) This way you can select multiple news groups in one go, choose perhaps a dozen each time. You will then see all news groups you highlighted displayed in the News groups Field.

Next: select/highlight your news groups, then click "To News" place a sensible title in the "Subject" location, click on "Attachments" where upon another box appears. Locate the file you are going to distribute, click on the file and then click "Open" again click OK; provided you followed these instructions, you should see your file greyed out in the "Attachments" box.
Hit send . . . and that's it.

Repeat the process over and over again by selecting further news groups in multiples of 10's but try to be selective with the groups by posting to high volume locations, and don't choose a subject that appears too flashy, this will only put people off. This is an honest and legitimate way of making a reasonable amount of money, and making it on a regular basis. But only if your message is sincere and clearly understood by others will you succeed.

PLEASE NOTE: This system is based on everyone being honest, but it's all too tempting not to bother mailing out envelopes with dollar bills inside. The success for all participating is dependent upon this taking place and if carried out will mean a 500% increase on your article being redistributed! The system won't work to yours or indeed other people's advantage if you don't follow the procedure. You can however, if you wish to remain anonymous use a pseudonym - but please ensure that your address is correct.

AS A FINAL NOTE: Many business ideas for making money, no matter how well thought out and implemented, simply don't get off the ground. And in most cases is due to advertising costs, but the exposure obtained through the Internet is quite honestly -- pretty awesome, so please study this article carefully taking all the time you want, because the moment you begin participating you will be on track for some serious financial rewards.

By the very nature of the way the system works you may not see the benefits the first week. BUT COMMENCING THE SECOND WEEK, YOUR INTAKE OF MAIL FROM AROUND THE WORLD WILL TRULY ASTONISH YOU!
Please give this some serious thought, because this is one of the few money making ideas that really does work.
The one that sends this file take no responsebility of the contents or substance of this text. The mailer of this text-file are not the author.

If you don't want to throw out money unnecessarily on a TNC,
you might as well use something like the Baycom PICPAR or PAR96
device. We once used a very similar device at 76k8 on a 486 and
could barely measure the CPU overhead.

> > After surfing the net, I read that Baycom is no longer allowed to be
> > distributed by network. The Baycom documentation states that you are

You can use PC/FlexNet, as it comes with Baycom drivers
(among other things). It's available from http://home.pages.de/~flexnet.

I guarantee you that the person has zero interest in advanced anything.
He wants to get into 1200 baud cheap.

I wouldn't implement advanced protocols on either of the two.

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn't it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving, Even without a fax machine! E-Mail Notification and Delivery, Without a PC!, Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888 Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial, Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection, Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

Though using HF would be more effecient in this circumstance, however on packet, HF is currently more like your example of waving flags to get the info across, ineffecient. Put TCPIP onto your BBS sfs, operate the BBS via telnet/ftp, link them all together with free linux routing software, and I'm sure a router program could be developed to route as much load as the slow modems that comprise your would-then-be network could take. I really have seen no arguements against tcpip besides the fact that you somehow have linked tcpip with a necessity to use a landline, which is not the case, it just happens to be what many are doing to overcome the limitations of your network. Can't you see that you are the one limiting packet? They have to resort to land lines to do what they want to do since you will not co-operate with bringing up a national tcpip radio network, as a matter of fact, you oppose it at every turn. Are these guys suppose to be gods, and they just summons up their on radio tcpip national network into existence without your help? And to top it off, you continue operating in THE original telephone line mode of store and forward (see a typical dial up BBS and see how its mail transfer system works, ala sfs).

I would say that you are the landline lid, since your are essentially telling everyone to stay on the telephone lines, unless you want to do store and forward, because I am not doing tcpip, no way, no how. That sure is the way I see it . . .

Hello everybody.

After looking at the "new" palmtops with windows CE on them I feel it is a good way of "unlocking" the computer from simple tasks as 4 people seem to want to use the computer at once at the momemt.

Anyway I was wondering if anybody knows if it is possible to use one of these to work on packet radio (specifically the HP 300/ 320LX or the cassiopiea) and what software /hardware is needed.

Many thanks in advance.

Well, you could argue that getting "into 1200 baud cheap", with Baycom
software and a TCM3105 based modem, probably home-built, has more to do
with amateur radio than following your recommendation of going out and
buying a KPC9612 and a TEKK. It's also more likely to lead to an
enduring interest in the mode.

Thank you. That was 6-7 years ago.

My point exactly.

You do not use the network you complain about, and in fact
have no clue what it can do. Please stop pretending you
are an expert until you have some actual knowledge.

>"little bit pregnant." It's going to grow on ya.

I don't think so. In the first place, there is currently very little outside
the LAN/MAN level that we can gut. There really is no packet switched
network above that level now. Nor is there much likelyhood of creating
one in the foreseeable future. That's a dead horse.

It is at the LAN/MAN level where we can do the challenging and interesting
things, and do them *well*. The internet is just a utility, like the power company.
We use it for things we don't do well ourselves (WAN services), but it doesn't
substitute for those things that we want to do ourselves, and that's packet
switched radio networks. We want to tinker with hardware, protocols, and
distributed applications, but we can't do that on commercial wireless networks.
They're Type Accepted and proprietary. We *can* do that with amateur LANs
and MANs. The internet can serve as a utility to tie the various experimental
communities around the world together into a large virtual network via encapsulated
wormholes. There's no other way to do it within the limitations we face as amateurs.

>chicken/egg thing.

Perhaps. Certainly in our area, the inability to do packet switched networking well over a primitive RF infrastructure drove us to make the needed improvements in that infrastructure. This was a huge effort, taking 10 years to get to a really adequate level. We learned a lot about building and operating packet networks over that period. Only a relatively small part of that involved technical issues. The notion that amateurs could duplicate what we've done on a global scale is simply beyond belief. But we've shown that amateurs *can* do it on a more limited scope.

Some of the lessons we learned were how to structure an organization which can endure, how to obtain and keep network sites, how far we can realistically stretch our technical manpower, how much everything *costs*, and how very *sparse* an amateur network is even in an area densely populated by amateurs.

>>a quasi-standalone manner on a primitive single tasking OS, in much

>however.

Only if they insist on remaining in the stone age. The tools needed to effectively support better paradigms are now available and inexpensive. The best OS for our purposes is *free*, as are the browsers and mail tools for use over the network. It amuses me that amateurs, who are supposedly notoriously cheap, have failed to jump on this with both feet.

>>>OK, you're going to go with the Internet. Fine. I like the 'net

>inevitably going to fade away because of this fact, it seems to me.

I believe you are wrong. Realize that packet is not just an adjunct to
the internet. We're merely using the internet to wormhole between
amateur packet LAN/MAN systems. We can't just throw open access
between the two because one is non-amateur and the other isn't. We
have to confine our unconstrained networking to net 44. We can offer
some gateway (firewall) access between net 44 and other networks on
the internet, but what we are doing is very different from opening an
account with an ISP. That's because of the limits Part 97 places on us.

Thus what we are doing is very different from what a user who purchases
service from an ISP is doing. Someone expecting that sort of thing will be
sorely disappointed by amateur radio packet. OTOH, we are free to experiment
with things an ISP wouldn't allow us to touch because it is *our* network, done
our way.

>>We can, of course, continue to experiment with such thin nets (there are some interesting
>>things we can try at HF, and with satellites), but we should be smart enough to realize
>>that they are, and will continue to be, too thin to meet the needs of internetworking the
>
>Perhaps our "needs" need to be redefined, then. One can do a hell of
>a lot of "impossible" things if you don't care who gets the credit,
>but just go ahead and Do It.

And you're welcome to try. I don't see any way to do it (global WAN services)
in a solely amateur radio context, and I've been at it a very long time. I've beaten
that subject to death already. But if you think you know a way to do it, go for it.

What I won't accept is some BBS sysop attempting to redefine *my* networking
needs to fit some quaint notions that he harbors. I know what I want, and if he
doesn't want to (or can't) deliver that, I'll do it another way.

TCP/IP is simply the defacto standard networking protocol suite of the
entire world ... apparently Charlie believes that *he* knows better than
all of the telecommunications experts in the entire world ... I think not.

> Greg Jones, Phil Karn, and other "Radioless Ham Radio" fanatics have

Charlie is a twit who doesn't deserve to be mentioned in the same post as
folks like Phil ... I don't know Gerg personally, but I believe he's also a
top-notch contributor ... he must be, the way Charlie fears him and reviles
him ... condemnation by Charlie (and Hank) is possibly the best reference
one could have in the ham radio networking community ...

It's 18 Jun 97 14:58,
We'll return to glenq@NOSPAMcyberhighway.net and All's
discussion of [1/2] What's wrong with Packet

gl> <lots deleted -- no serious disagreement here>

:-)

gl> We still talk "techie" on our 220 and 440 machines here, although not
gl> as much as we used to. A lot of it is computer related nowadays, of

I listen from time to time, and here it's basically ragchewing on the
repeaters. The techo discussion seems to take place in the backwaters
of 2m and 70. :-)

gl> course. Local repeaters are a great way to help new people get hooked
gl> up to a packet system and BBS, and show them how to work it, too.

Quite true. :-)

As for local conditions, there are two problems with our packet system,
the combination of which make it unusable for me. :-(

1. Severe congestion. The traffic flow is continuous, and we're in
need of a lot more high speed modems on the air. I monitor at various
times (all hours of the day and night), and the traffic on major
frequencies is literally almost continuous (and I can only receive one
node on each frequency!) The sooner we get 56k or 1.2 M, the better.
:-)

2. Holes in coverage. 2m is not too bad, and my problems are mainly at
my end (antenna is worse than wet string on 2!) However, that
particular packet node is clobbered by enormous signals, so I'd still
have trouble getting over the din even with the right antenna. :-) On
70, there are few stations (the only one I can hear is 30km away and
obscured by a hill). My antenna works well on 70, and that's all that's
letting me hear it (with S1 signal). More stations on planned
frequencies, especially on 70 would help here. I could fill a hole, if I
could get a feed via wire (to get a network link into the valley I look
down). The result would be a bit like a network cell 10 miles long and
a couple of miles wide (I'd be at the northern end of this cell).

Great. I thought that was your position, but I don't recall seeing you
spell it out this clearly.

So now that we've established this, how about uploading some PNW bulls to
Marty's system? Or, better yet, export them into a file, Zip it up, and
e-mail it to kb7cfd@cyberhighway.net so he can import them into our BBS?
We don't get much PNW news here. Who knows, I might even get motivated
to write a few of my patented *X* rated bulletins.

Careful, Gary ... next thing you know we'll have to listen to Hank and Charlie
bitching about all those "Powerline Lids" who don't have "pure radio-powered
packet systems using the BBS forwarding network" ...

[Glen said]

Me, too ... the apparent problem is that many hams are too backward
to manage the installation of Linux ... if it's not some totally automated
installation from Microsoft, I guess they can't handle it ... (I am admittedly
using the M$ virus myself, but I have installed, operated, and used several
_nix'es over the years ... being capable is not my main driver right now, it's
having to use M$ virus-hosted program for compatibility with work ...)
I expect to add two more P160+ class machines to my home ethernet LAN
in the next few weeks, one of them will be running Linux ...

> I believe you are wrong. Realize that packet is not just an adjunct to

All of what you say is true, Gary ... it is sad the way that Hank and Charlie have muddied the waters and generated so much confusion about these things ... all on the basis that their beloved dumb-terminal-login/BBS paradigm is being abandoned in favor of better things ... it's the same sort of Luddism that motivates a lot of the pro-code fanatics, with the added twist of the author's ego rolled in in Hank's case, I think ... if Mr. Morse were still around
I somehow doubt that he'd insist that everyone ignore all of the more modern methods in favor of his ancient invention ...

> What I won't accept is some BBS sysop attempting to redefine *my* networking
> needs to fit some quaint notions that he harbors.

That is pretty clearly what Hank and Charlie are trying to demand ... and they attack anyone who uses or advocates the use of better methods than their "quaint notions" support ...

Perhaps your network virus has not managed to reach everywhere,
despite your efforts to trash the network and make a busy-body of
yourself ....

As Steven said, the fact that your software is broken doesn't change
reality ... as I told Charlie ... I was on packet before you wrote your first
packet BBS code ...

Gee, that's funny... In the version of this story you gave me earlier this
year, there had been an HF forwarder there before you set up shop. I guess
you didn't want to mention that fellow this time around, huh?

>I got interested in
> the DX clusters on the internet, and put a TCP/IP package together

How is a TCP/IP package needed to set up a DX node? That doesn't make any
sense.

>Since I already had the wireline
> link set up to do the cluster, I offered to get some bulletins from the
> US of A for the other BBS here.

Oh, now I see.. You "needed" TCP/IP for the "wireline" link. That appears
to be what TCP/IP is primarily used for. -- "Radioless Ham Radio".

No hams on Guam clever enough to use radios, I suppose? Or, as is more
likely, were there HF links to Guam before you set up your LandLine Lid
system, but now they are gone?

3531. HTX-202 on packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-19 00:00:00 UTC
From: John Anderson <johnande@interl.net>
Message-ID: <01bc7ca5$63614b60$15a2f4cd@johnande>
Source record: 29293

The connection that works is similiar to the one for ICOM ht's, except that the resistor from the mike plug to the ptt line has to about 1200 to 1500 ohms. Try the highest value that will key the rig. ICOM handhelds work with 15k or higher, but the HTX-202 will not key with that high a value.These rigs work good on packet, just have to have a lower keying resistor than Icom.

3532. Re: Is there any Software that uses Sound Card instead of TNC???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-19 00:00:00 UTC
From: mbergman@orednet.org
Message-ID: <5ocgs7$oph@ednet2.orednet.org>
Source record: 29294

In a previous article, tjohnsto@erols.com ("Tj Johnston") says:

>It would seem with all the advanced sound processing capabilities of the
>sound card available in the PC environment, someone would have written a
>program to replace the TNC using the sound card. Does anyone know if this
>has been done or maybe its a work in progress... I would be really
>curious... I really dont need another piece of equipment sitting on this
>desk...

Yes, this has been done, however, I can't find where I read about it.
You'll find the article relating to this by searching or asking in the
Linux Newsgroups. You might do some searches in Daja News using searchs
like... linux sound ax25 or simular. I thought I read about it in my
Linux Journal, but failed to find it there, as well. Sorry for not being
more specific, but... just letting you know.. someone HAS done this.

Jeff, the Baycom docs also say that one Ham can give a
single copy to another Ham. So, I will be happy to give you a copy of
the 1.6 that I have. Mine was purchased from PacComm and I can send
you a copy. Would you like it by email (a MIMEd zip) or we can
do it by FTP. Let me know.
If anybody else wants one, contact me by email. -Pat

Why use the internet when we DO have excellent radio connectivity?
I know we forward "everything" east ... 9600 baud to eastern Oregon.
Where does it get lost? Can't be more than 1 or 2 hops ...

If you are not getting "everything" via the vhf/uhf links, how about
joining in on HF?

I will not personally use the internet where radio links exist.

De jure is probably what you meant. (Depending on your view of the
role of standards committees.)

The de facto standards are slowly dying out, e.g. SNA, BISYNC, DECNET et
al.
tcp/ip will, in it's time, be replaced by other standards.

But the protocol used is unimportant. Users do not use protocols, they
use applications, and it was the applications to which Charles refers.

If you do not understand the difference between an application and a
protocol, I'm sure someone will help you out.

>
> What should we do?

What you need to do at this point is get together with the people who are currently involved in your sfs and break the idea to them and start coordinating an effort to get all systems thinly connected via tcpip. You will also need to move your bbs onto a telnet capable machine, which also needs ftp to do file transfer. You don't even necessarily have to buy new hardware immediately . . . 1200 may be slow but it can move mail, and it will allow you to get the practice in you need to put in the powerhouse networking system we need to eliminate fiber as a primary carrier. Even an x86 will serve as a simple router while your getting things balanced at 1200baud.

Yep, over a switched network of course. I guess it makes no difference that same pop server can be accessed in Japan in less than 20 seconds. Of course that has no relevance to using packet switched vs. store and forward, in your mind. In my mind it is global access, which is what

voice amateur radio enjoys daily, so why can't I have it over packet?

> > I would say that you are the landline lid, since your are

Where have you endorsed TCPIP? I must have missed it. The posts from you that I have read, have simply noted that packet switched tcpip network is ineffecient, hard to setup, and therefore useless. You have not backed your reasoning that it is ineffecient, though its probably obvious at this point that it is still involving to setup (but who cares? its ham radio, we expect a little work, and emotion has nothing to do with it, more like why we call it amateur, its in the word), though that will be overcome in time for the weak who can't handle setup on their own.

Sincerely,
--

And you will manage to create a global radio network how?

Tell us your suggestions.

As pointed out several postings back, we are all ears,
willing to cooperate, have resources available, and are
anxiously awaiting your suggestions.

It's 19 Jun 97 06:11,
We'll return to dlpearce@eos.ncsu.edu and All's
discussion of What's wrong with Packet

dl> I agree that amateurs should go mobile (I am currently working on a
dl> point and click solution to this problem), and its somewhere we can
dl> excel, however, I am not sure that auto rerouting (no broken pipes)
dl> will be possible anytime soon. It would seem to me that it would
dl> require a whole new level of bandwidth, to carry all of the messages
dl> that would be generated each time a person switches access points.
dl> However given more bandwidth and some slick hardware, you could have
dl> software that measures signal strength, keeps a list of active access
dl> points made from probes, and automatically shifts to different access
dl> points as you drive around. If scope was limited, it could work
dl> effeciently. If pipes did not have to be maintained (they don't under
dl> any browser or email software, unless a transaction is currently in
dl> progress), bandwidth need would be reduced by allowing the software to
dl> just obtain new IP numbers as your car moved along, and returning old
dl> numbers before going out of range.

There might be something in this, though I suspect a new protocol would
be needed - one which assigns an address to specific machine, and
dynamically routes between all points on the network (to keep track of a
mobile station's movements). Somehow, you'd have to be able to have an
end user with a known address, and still be able to route to them, no
matter where they might be on the network, without clogging up the
network with enormous routing tables or excessive routing traffic...

Hmm, a big challenge, but if amateurs pull it off. :-)

... He who knows that enough is enough will always have enough. -LAO TZU

>
> An amateur radio operator would view the process differently, of course.

What the heck does this have to do with TCP/IP logic or
being "TCP/IP fanatic". It strikes me that almost every company
and millons of people are DIRECTLY using TCP/IP. It require electonic
digital links preferbly with speeds greater than 9.6K baud.

3554. 220 digital repeaters??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-20 00:00:00 UTC
From: rsavage@madison.tec.wi.us
Message-ID: <rsavage-2006972338580001@f209-133.net.wisc.edu>
Source record: 29076

A few years back the FCC slightly expanded the 222-225 band for
high speed digital use. I am wondering what groups took advantage
of this increased spectrum allocation? (I think it was from 219-220
Mhz) I think the original idea was for point to point links.
But it has been my opinion that the 219-220Mhz would be
great as the repeater input for a 219/224Mhz 56k digital repeater.
(with a 5Mhz split) I think 220Mhz bit regenerating repeaters are one
of the few available technologies that COULD create a viable terrestrial
packet network. I don't know how if the FCC would allow the use of
this one Mhz of frequencies for repeater operation. But having
a nationwide packet network made up a "high speed" point to point
links would require massive infrastructure and is never going to
happen because it's just too expensive with no money to be made.

Gee, I must have missed the revolution that appeared since
1991! There must have been a quantum change in capability.

What quantum change occurred since 1991?

Now, if only there was a 9600 BBS within a 100 miles so I
could see what I'm missing! Darn...

What year do you predict that you will by-pass the internet?

Steve

Well, we've seen a fair bit of bias against TCP/IP here in the UK, but folk are coming around, same for Linux.
In my long association with amateur radio, guys have been agin every single thing that came on the scene..... transistors, commercial gear, SSB, packet, IC's, you name it some were agin it and most eventually ended up using what they were so set against. I'll lay bets that TCP/IP will become accepted and the next thing that hits the scene will suffer the same fate for a while.
It's a human malaise that will always be with us, so I pay little attention other than correcting mis-statements. One ham here was so rabidly anti-linux, having not seen it, that some guys reckoned it was worth a look at, he shut up when he saw he was in his own way advocating the very thing he was trying to rubbish.

I'm beginning to see the logic here. Not that I agree that it's the
best way to do things, but it makes more sense than most of the
fingerpointing and namecalling I've seen so far.

>Perhaps. Certainly in our area, the inability to do packet switched networking
>well over a primitive RF infrastructure drove us to make the needed improvements
>in that infrastructure. This was a huge effort, taking 10 years to get to a really

>The best OS for our purposes is *free*, as are the browsers and mail
>tools for use over the network. It amuses me that amateurs, who are
>supposedly notoriously cheap, have failed to jump on this with both feet.

They have. They've signed up with the Internet. What's the incentive
to build a network of your design here, when we can just pony up
$19.95 a month and do more than ham radio will ever do?

>Thus what we are doing is very different from what a user who purchases
>service from an ISP is doing. Someone expecting that sort of thing will be
>sorely disappointed by amateur radio packet. OTOH, we are free to experiment
>with things an ISP wouldn't allow us to touch because it is *our* network, done
>*our* way.

The only thing "different" is that you have to follow the Part 97
rules, which are restrictive compared to the Internet, plus you get to
experiment and innovate, which is a plus, but only to those few who
like to do that sort of thing. It's not enough to attract a critical
mass to your New Paradigm without something more than what I see here
so far. I suppose the Packet Cluster types would enjoy it, because
it'll let them cheat their way onto the Honor Roll faster. There are
probably some other niches, too, but I don't see any right now.

>>Perhaps our "needs" need to be redefined, then. One can do a hell of
>>a lot of "impossible" things if you don't care who gets the credit,
>>but just go ahead and Do It.

>And you're welcome to try. I don't see any way to do it (global WAN services)
>in a solely amateur radio context, and I've been at it a very long time. I've beaten
>that subject to death already. But if you think you know a way to do it, go for it.

I'm saying that perhaps the goal needs to be redefined, not the
methods for achieving YOUR particular goal.

>What I won't accept is some BBS sysop attempting to redefine *my* networking
>needs to fit some quaint notions that he harbors. I know what I want, and if he
>doesn't want to (or can't) deliver that, I'll do it another way.

Well, there you go. You've beautifully illustrated what I've said now
for about 15 years; ham packet will *never* reach its potential,
because hams cannot and will not cooperate and coordinate enough to
make it happen. Looks to me like you're part of the problem, not part
of the solution.

Source record: 29080

Hank Oredson <hank_oredson@mentorg.com> wrote

> Tell us what to do, and we will do it.
> (There is the cooperation you wanted.)

1. Create a LAN using 9600 repeaters (minimum) with
internets of 115 kbps between them. Then offer an Internet
WAN or an equivalent radio WAN (minimum of 56 kbps).

For example, a 56 kbps link between Portlland and Eugene,
and a 33 kbps link between Internet nodes in different states.

2. Do NOT use Netrom, Rose, or Texnet for the internet.
They are forbidden in this network. The goal is one protocol,
no mix and match.

3. No user ports below the speed of 9600. There will be no
1200 baud user ports other than APRS. The intent is to kill
all AX.25 below 9600. Every 100, 300, and 1200 AX.25 unit
sold in 1997 shall be loaded on a truck and thrown through
the manufacturers window, then set afire.

4. SSH (Secure Shell) between sites (encrypted, compressed)
to keep the 44net private, with no outlets to the Internet. All
internet mail will be processed by a robot before being moved
to the private network (language, LID list, etc). The encrypt
code being distributed via membership. Any leaks deemed
a violation and node removed.

Suggestions? Improvements?

No whining. No BBS loss hand-wringing. Just do it!

Coffman:

> > I don't see any way to do it (global WAN services) in a solely amateur
> > radio context, and I've been at it a very long time.

> I'm saying that perhaps the goal needs to be redefined, not the
> methods for achieving YOUR particular goal.

Correct me if my interpretation is wrong Glen, but I think you're saying
that we shouldn't be attempting a true global packet network if we can't
achieve it by purely amateur radio means. Or at least, save this for
the future when maybe we can.

> ham packet will *never* reach its potential, because hams cannot and
> will not cooperate and coordinate enough to make it happen.

What the landlines can do is to enable those who can cooperate to bypass
those who can't. At the very least, they enable amateurs to experiment
with a 'proto global network', and at least prepare the more local networks
for its appearance, and evaluate the scale, impact and feasablility of
such a network.

It would help us to decide whether it might then be worth the time, trouble
and effort for radio amateurs interested in global packet networking to
raise some funds, and work in partnership with amsat to develop a
geostationary satellite based global network. But:- Given the lack
of cooperation 'between hams', will this vision ever succeed ??

(I'm not in AMSAT, but their efforts seem to indicate to me that
they are well versed in cooperation and coordination)

I *think* what Hank might say is that in the meantime, this proto
network grabs incentive from the efforts of 'long-haul' AX25 BBS
forwarders using pure radio. Perhaps a 'code of practice' at the
cableheads discouraging AX25 PBBS mail forwarding would go someway
to avoid this perceived 'unfair competition', Leaving Hank and Charles
to concentrate on any threat posed by 'internet forwarding' not
making use of encapsulated "44" amprnet over internet live linking.

That would leave a TCP/IP based "mail with wires" to compete on a fair
basis with AX25 "mail without wires", and hopefully allow users to
vote with their feet as to how they prefer to send mail.
Naturally, a measure of cooperation would be needed to ensure that
mail can be passed between the two systems, and the wishes of the
sender respected. (e.g. mail sent from a TCP/IP box would be sent

the long-hop on the wires, and mail sent from an AX25 PBBS should
not touch the wires - there would hopefully be a radio mail gateway near
the receiving end to allow transfer if the receiver was on a different
network)

> Looks to me like you're part of the problem, not part of the solution.

I think that's a little bit unfair to say of Gary given the quality
and thoughtfulness of his postings.

There are many mansions in amateur radio, more than one in packet, and
there are going to be people within amateur radio just as interested
in 'communication' as 'radio' !!

73, Gareth.

I tried to run a Baycom under OS/2 and gave up. The problem seemed to be
in the Baycom driver. Talked to the Baycom developers in Germany via
email and they don't support OS/2. Bought a Kantronics KPC-3 instead.
The KPC-3 works fine with Paket 6.1 under OS/2.

That's pretty ugly, and puts all the complexity on the user's shoulders. How is the mobile station to know he is about to go out of range? I think it is possible to solve the reroute problem without breaking the network or overly burdening the user. The number of routing updates needed aren't insurmountable, and are confined to the local area for the most part.

There's already a metric available to us in the routers to deal with multiple routes of differing qualities. All we need to do is to generate an automatic update daemon for that. It'd run in the background and shouldn't overwhelm the network unless there are thousands of mobile users in the local LAN. Even my most optimistic projections for amateur packet don't expect that.

The only thing the mobile user should have to do is periodically send an ARP broadcast to allow the various switches to get a metric for him. (This is similar to the way cellular phone works.)

It's obvious you haven't tried the Red Hat distribution. Installation *is* as
easy as for the Microsoft virus, except that you get to make some choices
that the virus wants to keep hidden from you when you do the install. Just
accepting the defaults will give you a working system, but you can customize
the install to a greater degree if you like. The RPM system also makes
upgrades a snap. And if your hardware is even the tiniest bit non-standard,
I'd ten times rather install Linux than Windows. It is way too easy to get into
situations with Windows where "you can't get there from here" and you have
to start over and go another way. That virtually never happens with Linux.

Linux comes with a *huge* complex of utilities and applications, which would be
separately purchased programs under MS. Those can take a good deal of setup
to get operating, but then so can separate applications you install into the MS system.
What seems to daunt some people is that you get to do all of this stuff *at once*
rather than bit by bit. Of course you don't *have* to configure everything at once.
You can do it bit by bit as you need it, just as you'd do with Windows add ins.

The temptation is to get everything from 6 CDROMs configured all at once.
Most people should probably resist that temptation. It can be overwhelming
even to the relatively computer literate. Take it step by step. Learn each system
one at a time, just as you would for separately purchased applications. That gets
progressively easier as you gain familiarity with the unix way of doing things.

Dosemu is practically bulletproof. You can run virtually any DOS program under
Linux as if it were a native program. And of course you can have many such DOS
applications running at once. (There's also a good CP/M emulator for those
whose legacy applications go back that far.) Wine isn't quite as well evolved yet,
but you can run the common Windows apps such as Word and Excel on Linux right
now. Some games work too, but others don't. Wine remains a work in progress, but

it gets better with every release. I'm still using Win95 on one machine for those odd programs that Wine can't handle, but those are becoming fewer and fewer.

Of course the basic Linux system is POSIX compliant, so you have the entire universe of unix apps available to you. Typically those arrive as source and you have to compile them. That's not hard, and because you have source, if you don't like the way they work, you can fix them.

Linux is also the only OS with built in support for amateur applications. There aren't any kernel drivers for packet included in Windows, but there are for Linux. And again, you have the source, if you don't like the way they work, change them. And writing new device drivers is relatively painless, so supporting next generation amateur applications is fairly easy. (Writing device drivers is never completely trivial under any OS, but it's easier under Linux than most. Often you can take another existing driver and just modify it to handle your new application.)

It's the *only* way we can do a global packet switched WAN at present. It is
either this, or remain isolated in disjoint little LANs. We can accomplish more
if we can internetwork with a larger community of interested people.

True. There are only a few thousand 56 kb RF modems in use worldwide.
We've shown the way, but we aren't going to come to your hometown and
do the work for you. If you want a competent LAN structure, you're going to
have to do some work yourself.

I know. Just as long as they don't expect me to stay down at their level, I have no problem with that. I can suggest that there are better ways, I can show people how to do things in a more competent fashion, but if they don't want to do them, I'm not going to take a strike team and go in and drag them kicking and screaming into something they don't want to do. I'd expect the same courtesy from them in return, though realistically I know I won't get it.

>$19.95 a month and do more than ham radio will ever do?

I'm afraid you've lost me there. What does Linux have to do with signing up with an ISP? Linux is an excellent OS for those interested in amateur radio data networks because of its built in support for packet devices and its native networking software. And most of all because it all comes in source so we can make any changes we'd like to it. You can use it with your ISP too, if that's what you want to do, but that has nothing to do with its utility for radio amateurs.

The incentive to build a competent amateur packet switched network is so one can work with the guts of the hardware and software that make up an advanced network, and so one can develop novel applications which exploit unique facets of its distributed computing nature, especially for mobile networking.

If one only wants to sit home and web browse and exchange Email,, there's no incentive to build any sort of packet network or link it into a global WAN via any
means. One only has to sign up and pay $19.95 a month to an ISP for that. I'd encourage people who only want to do that to do so and stay off the air. Why would we want to encourage such people to participate in packet? Other than serving as test loads, what purpose would they serve?

>>Thus what we are doing is very different from what a user who purchases
>>service from an ISP is doing. Someone expecting that sort of thing will be
>>sorely disappointed by amateur radio packet. OTOH, we are free to experiment
>>with things an ISP wouldn't allow us to touch because it is *our* network, done
>>*our* way.

>The only thing "different" is that you have to follow the Part 97

>rules, which are restrictive compared to the Internet, plus you get to
>experiment and innovate, which is a plus, but only to those few who
>like to do that sort of thing. It's not enough to attract a critical
>mass to your New Paradigm without something more than what I see here
>so far. I suppose the Packet Cluster types would enjoy it, because
>it'll let them cheat their way onto the Honor Roll faster. There are
>probably some other niches, too, but I don't see any right now.

Then perhaps you are among that number who should simply pay an
ISP for his services and stay off of packet. Frankly that's fine by me.
It is not necessary that you participate. If you want to, that's fine, but
if you don't, that's fine too. There's an old saying that one shouldn't
try to teach a pig to sing. The result will be disappointing, and it annoys
the pig.

>>>Perhaps our "needs" need to be redefined, then. One can do a hell of
>>>a lot of "impossible" things if you don't care who gets the credit,
>>>but just go ahead and Do It.
>>
>>And you're welcome to try. I don't see any way to do it (global WAN services)

>>that subject to death already. But if you think you know a way to do it, go for it.
>
>I'm saying that perhaps the goal needs to be redefined, not the
>methods for achieving YOUR particular goal.

Sorry, that's not acceptable to me. If you want to pursue a different set of
goals,
go for it, but I'll continue to pursue the goals that I have. I have a clear
idea of
what I want to do, I have a clear idea of how to go about it, and I've made
considerable
progress toward making it a reality. Perhaps you can do the same with your
goals.

>>What I won't accept is some BBS sysop attempting to redefine *my* networking
>>needs to fit some quaint notions that he harbors. I know what I want, and if he
>>doesn't want to (or can't) deliver that, I'll do it another way.
>
>Well, there you go. You've beautifully illustrated what I've said now
>for about 15 years; ham packet will *never* reach its potential,
>because hams cannot and will not cooperate and coordinate enough to
>make it happen. Looks to me like you're part of the problem, not part
>of the solution.

If the solution is a loose group of non-realtime BBSs doing the equivalent
of uucp dialup forwarding but happening to be using radios, then I don't want
to be part of that solution. I've already been there and done that. That has
nothing
to do with packet switched networking. Packet switched networking is my
interest,
and that's what I'm doing. If some BBS ops want to run over the networks I'm

working on, they're welcome to do so, of course. We have plenty of capacity.

If you want to do something else entirely, go ahead, but don't even imagine that

you can demand that I do it too. This isn't the army, and I didn't volunteer to be
your slave. I'm happy to work *with* others toward mutual goals, but I don't work
for others unless I'm paid.

While I doubt Hank is being sincere here, there are a number of things which could be done. But first there must be a realization which may be painful. And that is that we can do some things well via amateur packet radio, but we can't do all things well via amateur packet radio. We should take a realistic look at what we can do well, and do that. And we should take a realistic look at things we can't do well and find alternative ways to accomplish the tasks we need done. That may include using resources outside of amateur radio.

First of all, what we can do well is high performance LANs and MANs. We should be pushing as hard as we can to do so in every packet community. Most of us have lived so long in really horrible low speed LANs that our natural first inclination is to conserve bandwidth at all costs. That idea has been very crippling. It has made the internet seem a very attractive alternative to many in our user communities. And it is unnecessary.

We know several ways to do high performance LANs and MANs. In Ottawa and in Georgia, we base our LANs on 56 kb duplex repeaters. That's off the shelf and it works. But there are other ways. Glen Elmore's Hubmaster is another way. CDMA clusters are another way. Karn's microcells are another way. Etc. Amateurs should be looking at all of this and implementing the systems

which make sense for their specific terrain and user communities. It is likely that one size won't fit all and that we will wind up with a number of different LAN topologies and link level protocols in order to best deal with our particular situations. We shouldn't be afraid to be different as long as we're fast.

Where feasible, we should be linking our LANs into MANs with the highest speed trunks we can fashion. 56 kb is the *slowest* speed we should consider, and that should be full duplex. We should do much better if we can. We should be thinking in terms of T1 systems, or ethernet over gunnplexers, etc. We know how to do this, and terrain permitting, we can do this.

But once we get past about 8 hops, we run into another problem, latency. That's the demon which kills any hope of a national or global switched network done completely over terrestrial packet switched radio. Each hop we make doubles the effective latency of the underlying transport, IE if we're running 56 kb, a relay hop increases our response time to that of a 28 kb circuit, two hops increases our response time to that of a 14 kb circuit, etc. By 8 hops we're down to a response time slower than a 300 baud circuit.

Now we still have the throughput of the fast channel because we can pipeline our data, but the responsiveness of the network gets so bad that we can't do realtime events anymore. The network is no longer transparent. Things we can do on a LAN break when done over the network because of the huge latencies we accumulate. That's not acceptable.

We reach this point at a distance of about 400 miles (varies according to terrain). So that's about the maximum size we can directly network with terrestrial VHF/UHF switched backbones. There are other possible options. The way the wired network gets around this problem is to have long distance bypass trunks. They span in a single hop distances which would take hundreds of hops in normal practice.

We can attempt to do that in amateur radio three different ways. The first and most desirable way is with a GEO satellite. That can span a hemisphere in a single hop. If there is adequate transponder capacity, this can be an ideal solution to our problem. But GEO birds are horribly expensive, and power is incredibly dear. To do this we're looking at a cost 20 times that of P3D, and that stretched amateur finances to the limit (and perhaps beyond). Plus we need teleports at most of our MAN sites. That's not horribly expensive when looked at one at a time, but the total ground station network rapidly becomes hugely expensive as well. I'd suggest that this system is beyond our means at this time. Cheaper launch costs may eventually bring this within our reach.

The second way we can do this is to install systems of terrestrial bypass trunks. These span dedicated routes using bit regeneration instead of store and forward switches. That gives us a minimal impact on latency, with the loss of but a single bit time per relay. These trunks would need to crisscross the continent in parallel with the switched trunks for more local transport. And they must be non-contending and have a very good SNR and fade margin. This too becomes hugely expensive, even more

costly than a GEO relay. I'd suggest that this too is beyond our means, and likely to stay that way indefinitely since there is nothing on the horizon which will reduce its cost.

The third way we can address the problem with amateur radio is by using HF. This can span a continent in a single hop, and at very low cost. We are at the mercy of propagation, but with ALE techniques and frequency agility to follow the MUF, we can mostly work around that. The real problem is capacity. We are limited by regulation at HF to 300 baud. We can use symbol overloading to get a higher bps than that, but capacity is still a very very serious bottleneck. We can do *very* thin trunks at HF, but barring major regulatory reform, we can't handle the bulk of our transcontinental traffic this way. It'll do to handle a few mouse clicks, but it can't serve most of the applications we'd like to run.

Now with smart network software, we can pair our switched trunks, with their high capacity and high latency, with our HF links, with their very low capacity but also very low latency to form an asymmetrical transport. That can service some applications in a satisfactory way. This is something we should try, especially for shorter distances such as the 8 to 16 hop range between MANs. It might prove quite useful. But it is unlikely to be satisfactory for a continental network.

Those are our basic amateur radio packet switched network options. None of them are likely to be feasible soon, none are totally satisfactory, and none of them are easily implemented. All of them are likely to need different link level protocols to perform satisfactorily, even some of the LAN/MAN concepts require a different link layer protocol. So we are faced with internetworking over them. Fortunately, that problem has a solution. It is called TCP/IP. It is designed to work over varying link level transports. Whether that's AX25, or a token passing protocol, or even non-packet transports like Clover, TCP/IP can run on top of them to form a coherent internet where any user application can work with any other user application, no matter where in the networks they may be.

Now it should be clear that we aren't going to have a national packet switched network with totally amateur transport for a long time to come. And we may never be able to supply a global network. The costs are too high, the latencies are too long, or the transports are too thin. But there is an alternative. We can make use of the wireline services to provide wormholes between MANs we can't service properly with amateur trunks. Primarily this is suited to dealing with the long distance bypass trunks needed to reduce latency, IE where end to end distances are greater than 400 miles. This can be hugely useful to us by allowing us to integrate our LANs/MANs now instead of at some indefinite time in the future. This can let us work now on applications which can be transparent network wide. This can let us collaborate now with our counterparts in other LANs/MANs all over the world. All of these things are highly desirable.

The downside as some see it is that use of wormholes negate the need for alternate amateur transports. Perhaps that's true, but the availability of direct dial telephones in some sense negate the need for amateur radio at all. But we still want to do amateur radio, and we still want to do amateur packet. That's because we're in charge of our own network and can tinker with it any

way we like. We can't do that with the network of a commercial provider. So I expect people will still be building trunks between the MANs whenever and wherever it makes sense to do so. And I expect people will be experimenting with HF thin nets and plotting to get satellites in orbit. But in the meanwhile, we can use the wireline provider as a utility to fill in the areas where we can't yet do it properly ourselves. If we don't, we'll be doomed to disjoint LANs with much more limited abilities to do the sort of advanced network applications which we could otherwise do. That's very likely to reduce interest in amateur packet to the point where we'll never be able to support any of the expensive amateur radio alternatives to the wireline. And that would be a huge opportunity lost.

This presumes that Hank is knows everything that goes on
everywhere, all the time, throughout the entire world on every
frequency ... not a very good bet ...

This entire line of crap (it doesn't qualify to be called "reasoning"
or "thinking") is bogus, Hank ... what makes you think you have
knowledge of everyone's actions??? I am confident that your
network virus is not so good as you might hope in ferreting out
everyone's business ...

And I don't have to some sort of Hank-worshiping masochist,
frustrating myself on a daily basis trying futilely to send messages
through your stupid store & forward BBS kludge on links that
are so unreliable that they might as well not be there to make
the judgement that your solution is totally inadequate ...

Please don't waste any more of your time trying to figure out
if I'm using your "network" ... I'm gave up trying some time ago
and have better things to do than waste my time with your
"solution."

I'm using flexnet with a soundcard. The docs are better now, but
I wrote up a step by step discussion of how to get it running and
put it at the following ftp site:

ftp://ftp.tapr.org/pub/wa0ptv

In addition, the software itself is there.

I have tried to run this at 9600 baud, but have had little success.
The problem is not with my radio (its the save modified 736 I use
on the 9600 baud satellites). I can connect ok at 9600, but longer
packets don't seem to make it. I'm wondering if anyone has had
success with flexnet/soundcard and 9600 baud?

We're using the 219 MHz band here for dedicated point to point trunks.
You can't do what you want here because usage must be coordinated
point to point links only, not repeater use. The ARRL acts as the clearinghouse
for this required coordination with the Waterways Service, which is primary
on this band.

Note that we are also using the 222 MHz band for in-band repeating. The
standard voice split for this band works fine for 56 kb. We also have 56 kb
repeaters in the 440 MHz band, and there we do use a 5 MHz split, just like
the FM voice repeaters do on that band.

The reasoning is, that the links should be stable at high speed, and then
the LAN allowed to grow. Most Hams find 9600 repeaters acceptable for
a LAN. 56 k is better, but I suspect that the old kit versions are gone now,
and the new ones from PacCom a bit pricey yet.

Yea, I've seen that a lot in Ham radio packet. Everything is in series,
rather than parallel. It's like they never got past Block I electronics
(serial circuits) to Block II :-) You have to go north to go south :-)

When the repeater came up for the first time, it was real quiet until
all the netrom heathen came on frequency. Now there's beacons,
Node lists, etc, etc. It's crap. If you put up an X-1 node, at least
have the decency to shut off the netrom. Not to blame netrom, it's
just that the users don't ever read the fricking manual. But I don't
like the protocol. It is functional only as a port, not a transport.
The really bad thing, is its IP can't do segmentation with large MTU.

I used the encryption idea because SSH has that and compression
in a free package available today. If you know of another package off
the shelf, let me know. One of the things I like is compressed mail.
Most files will be compressed already. Thus, with SSH you should be
able to select which TCP port has compression. The intent is to keep
Hams from connecting to the public network, and instead connecting
to their fellow Hams. That some standard tool be used. I guarantee
that some guy will think the two should be fully connected and unless
some membership tool is in place, you won't be able to plug the leaks.

>and the new ones from PacCom a bit pricey yet.

Yes, the kits are history. The PacComm 56 kb unit offers 6 times the performance of 9600 baud. But a 9600 baud modem, and the radio it needs to operate properly, isn't 6 times cheaper than the 56 kb RF modem, including the transverter it needs. When you do a side by side comparison, you'd have to be insane to setup for 9.6 kb when you can have 6x better performance for only about 2x more money. The unit is in the same price range as some multimode units, which only do 1200 baud tops, and they still need a radio on top of that.

Now what does 6x 9.6 kb buy us? 9.6 kb is almost tolerable for interactive packet operation if the channel is quiet. But as the channel becomes busy, it quickly becomes unacceptable for interactive use. With 56 kb, performance is highly satisfactory on a quiet channel, and still usable when channel activity increases 6x. So, you're getting either 6x the performance or 6x the tolerable LAN loading with 56 kb, for only about 2x the price. That's a deal.

But we can do better than that. Forget 56 kb, we can adopt the Hubmaster scheme of Glen Elmore and have 256 kb radios running in a slotted system. Now we have 24x the performance of 9.6 kb, for about the same cost as the 56 kb system. *And* because it uses a slotted protocol, we have completely predictable response times. Or our users could build the Slovenian 1.2 Mb data radios, again for about the same cost, and really fly.

It makes no sense to poke along at 9.6 kb when we have options like that for very little incremental cost. Now the latter two options require the user to do more than just burn the plastic, but then so did the GRAPES kit back when it was available. Several thousand people took up that challenge. We arranged to have it produced W&T for those who can only burn the plastic, and that makes it easier to field than a 9.6 kb system which almost always requires radio modifications to work properly. But we really should expect more from

our power users than for them to be appliance operating parasites. It won't
hurt them to discover which end of the soldering iron gets hot.

When you have adequate channel capacity, a few node routing
broadcasts don't mean a thing. TCP/IP is *not* a good solution
at the link level for many topologies. It needs another transport
with hop by hop acknowledgement to run over. Netrom probably
isn't it, but there probably isn't a one size fits all link level transport
for all the varying topologies of LANs, MANs, and WANs we want
to use. AND WE SHOULDN'T CARE ABOUT THAT! Use what
works best at the link level on a link by link basis. TCP/IP then
internets over top of those different protocols. That's what
it was designed to do.

>the future when maybe we can.

No, I don't say we shouldn't have anything we want. Perhaps we should
re-think HOW we are going to get there. Like it or not, there WAS a
functioning global packet network at one time, and it worked fairly
well, all things considered. It doesn't seem to work very well now,
for various reasons, one of which is competition from the Internet.
That competition is only going to get worse in the future. Do we want
to fight 'em, join 'em, or find some other alternative?

Yes, I agree, and I'm not so sure that the Hank/Charlie side of the
argument are adamantly opposed to this option, either. Still, that
scenario leads almost inevitably towards a purely wireline net for
most of us. As I wrote earlier, where's the incentive for me and my
friends to build or improve our radio system when we can do the same
things and more for less money and a LOT less work right here on the
'net?

>of cooperation 'between hams', will this vision ever succeed ??

Not to my way of thinking. It sure won't without some strong
leadership, probably from the ARRL in cooperation with folks like TAPR
and perhaps AMSAT. We need people like Hank and other pioneers on
board, too. Do something like what I understand happened with AX.25.
Get the factions together, lock them in a room, and don't let them out
until they agree at least on a goal and a method to achieve it. <g>

>(I'm not in AMSAT, but their efforts seem to indicate to me that
>they are well versed in cooperation and coordination)

For a small, elite group, yes. But how many "average hams" are
members or use satellites?

Perhaps, but he indicated that he was going to do things "his way" and
everybody else could piss up a rope. That may not have been what he
meant, and I may have been harsh in my interpretation, but it's a good
illustration of the problem. Leave Gary out of it, and you still see
the same attitude on this very NG every day, complete with boilerplate
ad hominem in every post.

>There are many mansions in amateur radio, more than one in packet, and
>there are going to be people within amateur radio just as interested

>in 'communication' as 'radio' !!

Ham radio is changing. Moving to the Internet may well be part of that change. There's more to this whole issue than just radio vs. wireline. We have to _use_ our bands in order to justify our occupancy.

Ah.. Finally some technical discussion.

In <33ac3889.103519747@news.atl.bellsouth.net> ke4zv@bellsouth.net (Gary Coffman) writes:
>But once we get past about 8 hops, we run into another problem, latency.
>That's the demon which kills any hope of a national or global switched

>circuit, two hops increases our response time to that of a 14 kb circuit, etc.
>By 8 hops we're down to a response time slower than a 300 baud circuit.

I am a little confused by your analysis of the effects of latency. Link speed being constant, latency goes up linearly with each hop, not double. In fact, paths of over 8 hops (given that link speed is resonably high (say megabit rates) and loss rate is resonably low (<10^-5)) work pretty well for non-interactive application protocols (FTP, POP, HTTP). E.g., my path between my own internet node and netcom.com is exactly 8 hops, and averate RRT is about 100ms. This is usable even for telnet.

But your point is well taken with link speeds and loss rates currently seen in amateur packet. BUT, if you go with multi-megabit SS links with some sort of FEC to get the loss rate down, more hops may still work well.

>Now we still have the throughput of the fast channel because we can
>pipeline our data, but the responsiveness of the network gets so bad
>that we can't do realtime events anymore.

This is certainly true for what I would call two-way interactive applications. That is, an applicaton where the user-perceived latency involves one or more packet round trips (e.g. telnet with remote character echoing, Internet telephony, etc). But many classes of supposed "real-time" applications are actually not that delay sensitive up to pretty large values (e.g., Video on Demand, mulicast talks and presentations, RealAudio-type stuff).

But all this being said, I do agree that a more meshed backbone is need at the national/international level to run a usable IP-based network. With some sort of Class-of-Service-based routing criteria it would, in principle, be possible to route certain critical, but non-interactive traffic (e.g., SMTP) over the HF links. (For my own education, what work has been done running IP over HF links in the amateur community? Pointers to URLs or papers appreciated.) Another way to do this would be to put non-IP mail "tunnels" between regional SMTP servers (although mail routing could start to become fragile in this config).

Don Hoffman (still sitting on his thumbs waiting for call sign).

>matter where they might be on the network, without clogging up the
>network with enormous routing tables or excessive routing traffic...

>Hmm, a big challenge, but if amateurs pull it off. :-)

Well, there is a significant body of work alreaday available in the IP world
that deals with this. DHCP (already available in most PC running Win95)
deals with the "local" address assignment part. Mobile IP (RFC2002 + some
recent extensions) deals with ths issue of how to find and transfer data to a
node that keeps moving around in the topology. There are some other folks
looking at the issue of how to find local versions of various resources
(e.g., printers) as you move around the net. These can (and, I am told, are)
being applied to amateur radio TCP/IP nets.

Straight-forward (at least conceptually) application allows me to move from
my home LAN (which in my case is wireless) to a ham LAN in different areas
without manually reconfiguring my machine or the other nodes I usually talk
to (assuming there is some sort of WAN (wired or wireless) between us).

There are probably two levels to the problem:

Mobility between different regions, and between the wired and wireless
networks. Mobile IP deals well with this issue.

Binding to the right "cell" in the local radio network. I was
thinking for a bit (in a previous message from this evening) that
Mobile IP could be used here also. (Each cell is a separate
subnet. And you would use some TBD mechanism to bind to the
cell) On reflection, you problably want the cells to be part of
the same network and use some combination of link-specific
measurments and host-based routing metrics as you suggest. (e.g.,
Metricom and the CDPD folks use the latter approach but mostly with
non-IP, link layer mechanisms)

In <33AAED1A.689B@mentorg.com> Hank Oredson <hank_oredson@mentorg.com> writes:
>The de facto standards are slowly dying out, e.g. SNA, BISYNC, DECNET et
>al.
>tcp/ip will, in it's time, be replaced by other standards.

Well, yes and no. The evolution of the Internet protocol suite will likely be slightly different than that of the proprietary protocol which it supplants. As it becomes more universal with a large and diverse installed base it is unlikely that it will be replaced in any meaningful timescale. Instead, componets of the suite will evolve and be replaced as new requirments and technologies come along. It becomes too expensive to throw away the whole thing all at once. You do it a bit at a time and try to keep the scope of your changes to the parts that are actually broken.

Because they only encompassed, for the most part, single organizations and users of a specific vendor's hardware, protocols such as SNA, IPX and DECNET were candiates for more revolutionary replacement when requirements and technologies changed. When the revolution comes along to replace the Internet, it will likely be something more radical than just a new protocol suite.

For example, we today see the Internet evolving to better support time-critical applications such as video-on-demand, Internet telephone, etc. Mobile and wirless are other examples where there is quite a bit of current research activity (e.g., GLOMO). I would venture that a 1/2 dozen new protocols are defined or evolve in the Internet world over the course of each year.

The Internet shares much in common with the switched telephone system in this regard (except the Internet is changing much more quickly). Certainly the PSTN has changed greatly in the last 50 years, to the point where the internals bear little resemblence between then and now. But at no point could you single out a point in time where it can said to have been replaced.

Building the amateur radio network infrastructure on Internet protocols (even if the direct connections are somewhat controlled) has the following benifits:

Access to the huge amount of working being done by the Internet research and product devleopment community.

The expectation that the work will be somewhat long-lived by association with a infrastructure that we expect to be, for all pratical purposes, permanent (or at least permancece equivalent to the telephone network).

There are a few more techie reasons why I think there are advantages over a store and forward network of BBS's but this message is too long already.

>But the protocol used is unimportant. Users do not use protocols, they >use applications, and it was the applications to which Charles refers.

>If you do not understand the difference between an application and a >protocol, I'm sure someone will help you out.

But protocols and application interact in not so subtle ways. For exampe, the WWW owes much of it character from the following properties of the Internet protocol suite:

Low connection set-up time. You can create and tear down many TCP connections in the course of a page hit
No per connection state in router means that a network can support many simultaneous connection between many different peer nodes.
Lack of a single administrative authority means that client and servers can be added in a more market-driven way.

Other protocols suites give you a much different (and potentially less dynamic environment) application character (e.g. compare the >application <characteristics offered by Compuserve or Minitel to the current Web. All offer more or less the same application, but folks seem to be prefering one over the rest).

>By 8 hops we're down to a response time slower than a 300 baud circuit.

How do you get an exponential growth in latency time for each hop
added ? If we assume zero time for routing and error checking
decisions, the only source of latency in a single hop is the
transmission time t of the message. Using 8 hops, the propagation time
through the chain is 8t, thus, the latency time is similar to a 7
kbit/s (56 kbit/8) system. However, if we are doing hop level
acknowledging and have only one transmitter, it takes some time
(hopefully much less than t) to send back the acknowledge, before
sending the data frame to the next station. Assuming zero Rx/Tx turn
around time, the added latency for each node is 2t. Thus, the total
propagation time for 8 hops is 16t and the latency is similar to a
3500 bit/s connection.

>to crisscross the continent in parallel with the switched trunks for more
>local transport.

If you already have a full duplex switched network using WA4DSY style
modems between two sites, adding a bit regenerating bypass trunk would
only cost the price of a single WA4DSY type modem at each hop. If the
bypass trunk uses adjacent channels to the existing channels, then
common antennas, duplexers and transverters can be used. Since these
modems can be tuned to any channels in the 28 MHz band, you just need
splitters and combiners at the transverter IF ports. You may have to
use a more effective transmitter, since it must now run in linear
mode, thus you may have to backoff the drive level to keep it linear.
Since there are now two signals transmitted, each will only get half
of the total transmitter power.

>And they must be non-contending and have a very good
>SNR and fade margin.

Realistically, doesn't the use of packet switched 56 kbit/s require
hops with better RF-quality that currently used, since retransmissions
are costly even in full duplex packet switched networks, if the
resends occur frequently.

>This too becomes hugely expensive, even more
>costly than a GEO relay.

Is the extra cost for a bit regenerating bypass trunk so large _if_
there exists a packet switched full duplex connection at the same
speed as the intended bypass trunk.

> I'd suggest that this too is beyond our means,
>and likely to stay that way indefinitely since there is nothing on the horizon
>which will reduce its cost.

>WAN or an equivalent radio WAN (minimum of 56 kbps).

That's probably backwards. The LAN needs the highest throughput
possible because it is where the bulk of the activity and interactivity
is. The MAN linkage doesn't have to be quite as fast because it carries
less traffic. And the WAN link can be slower still because it carries even
less traffic. But the latencies of the MAN and WAN links have to be as
low as possible. This means few hops and relatively fast transport, so
that contradicts the raw throughput trend to a certain extent.

Note of course that the aggregate of all MAN and WAN links has
to have a very large capacity, but the topology should be arranged
so that no one trunk has to bear the brunt of it.

>2. Do NOT use Netrom, Rose, or Texnet for the internet.
>They are forbidden in this network. The goal is one protocol,
>no mix and match.

That's not a necessary, or likely even a desirable, decision.
At the lowest levels, the best protocol for the particular transport
link should be used. At the higher level, TCP/IP can internetwork
over any of them. That's what it does.

>3. No user ports below the speed of 9600. There will be no

>the manufacturers window, then set afire.

Heh, heh. Not likely. While I think many of us would like to see
Bell 202 retired to the dustbin, and since most users won't buy
proper radios for 9600, it should probably be discarded as well,
there isn't a chinaman's chance it's going to happen. There's
too much inertia in the user community. If you lock them out,
they'll just put up parallel networks (gross digipeaters all on
a single frequency), sapping resources away from your effort.
Of course their network won't work worth a tinker's dam, but
that won't stop them. They'll just add high power amplifiers to

the nodes and user stations (sheesh!) Give them legacy ports
to access the new network. The little loading they can place on
the new network won't even be noticed, and you can fleece them
for some coin to support it.

>4. SSH (Secure Shell) between sites (encrypted, compressed)

>a violation and node removed.

Well, you can use encryption on the wireline side, but don't let
any of it leak out to the radio side. That's forbidden. You really
don't need encryption anyway, a simple authentication protocol
will be sufficient to keep net 44 closed. Compression is probably
best handled end to end. Let the users' applications take care of
that. A trusted robot gateway (firewall) is probably a good idea
though.

You have to read some of the posted articles. You can't just continue on with this half-assed read one sentence, write a page of nonsense. When are you going to get off the fence? Make a decision, you can change it later.

Incentive IQ Test

I will give you two modems. One is equipped to operate using RF at 115 kbps full-duplex. The other only operates at 33 kbps full duplex, and only works over a phone line.

Which one do you choose?

I will give you two modems. One is equipped to operate using RF at 1.2 kbps half-duplex. The other only operates at 33 kbps full duplex, and only works over a phone line.

Which one do you choose?

A significant statistical sampling has shown that in all cases, the most popular choice is the higher speed modem.

That is the incentive. High speed RF will wipe out internet tunnels when the price is right.

I think the era of wideband channels is over (except for microwave). Any solution
that depends on a foghorn is doomed to failure. Sure you might get 10 years out
of it, but how many boat Captains do you know who really use them. Besides that,
neither of those two systems you lay before us are available in quantity, by phone.
You, others, will be buried for the next 12 months trying to find all the parts,
putting the parts together, and debugging the final product. That's not what I think
will save digital Ham radio. 24 times faster, at 24 times wider is not the solution.

> It makes no sense to poke along at 9.6 kb when we have options like that for
> very little incremental cost.

$200 beats $1500 every day.

> Now the latter two options require the user to
> do more than just burn the plastic

56 k is completely off the shelf. 9.6 k is completely off the shelf. We're
talking mere money here. There is no solder smell to either solution.

> When you have adequate channel capacity, a few node routing
> broadcasts don't mean a thing.

It causes the ongoing traffic to stop windowing and start again. It's
very expensive to broadcast. I swear 50% of the traffic at the company
I work for is ARP broadcast (who has, who has, who has...). Can't
ever find the router people to set the damn cache off the default 5 minutes...

> it was designed to do.

Fine. Then what we have now should be completely satisfactory?
My opinion is, that what we have now is crap. You seem to be saying that
it's not crap, it's how it's supposed to be done?

3622. ! PSYCHIC PREDICTIONS TRY-IT-FREE! IT'S FREE!!

3623. SW for PCI-3000

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-23 00:00:00 UTC
From: Bill Turini <dturini@aa.net>
Message-ID: <01bc7f7a$466d7f10$7c8dc7cd@mom>
Source record: 29035
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

After 20 years or so, I've decided to try the digital modes for something new. I recently purchased a HAL PCI-3000 that did not come with the original software. Does anyone have a copy of the software or does anyone know of any other software for this board?

I am mostly interested in listening to commercial stations, not really using it on the ham bands. I use the oldest form of digital communications there, cw.

Thanks

Bill KA5GAV/7 turinib@wdni.com

>situations. We shouldn't be afraid to be different as long as we're fast.

All this stuff should be publicized far more efficiently than it is.
I have more interest in this stuff than the average ham, and this is
the first I've heard of most of it. Nobody's talking about it on the
existing packet system. Nobody's talking about it in any depth in
this NG. It's not in QST or 73.

At the very least, there should be a web page that has all this stuff
available in a format usable by someone of average abilities, and it
should be well advertised. I suspect that some of it may be on the
TAPR site, but if it is, it hasn't been publicized well enough.

>But once we get past about 8 hops, we run into another problem, latency.

>transparent. Things we can do on a LAN break when done over the
>network because of the huge latencies we accumulate. That's not
>acceptable.

Why does everything have to be in (near) real time? The beauty of the
packet system to me and many others is that you DON'T have to be on

line all the time to exchange information. Even UseNet operates this way. If mail and bulletins could be turned around in a 24 hour period reliably, that would be acceptable for most of us, I suspect. Even UseNet doesn't do that very well. Store and forward seems to be an excellent way to move large amounts of information over long distances with minimal investment.

Except for IRC type applications, what does ham packet need "real time" comms for? This is a serious question.

>The third way we can address the problem with amateur radio is by using
>HF. This can span a continent in a single hop, and at very low cost. We

>symbol overloading to get a higher bps than that, but capacity is still a
>very very serious bottleneck. We can do *very* thin trunks at HF, but barring
>major regulatory reform, we can't handle the bulk of our transcontinental
>traffic this way. It'll do to handle a few mouse clicks, but it can't serve
>most of the applications we'd like to run.

If we don't show a _need_ for more HF bandwidth, there'll likely never be "major regulatory reform," right? If hams were pressing for digital regulation changes as fervently as some of them are pushing for dropping CW regs, perhaps we could get at least an STA for wider bandwidth. The original STA for the packet HF BBS system worked pretty well, even if the majority of the people doing the forwarding were not legally part of the STA and were technically breaking the rules.

>The downside as some see it is that use of wormholes negate the need for
>alternate amateur transports. Perhaps that's true, but the availability of
>direct dial telephones in some sense negate the need for amateur radio at all.

Exactly. Cellphones and computers/Internet are competing strongly for most of the traditional ham tasks, and this will only get worse in the future.

>But we still want to do amateur radio, and we still want to do amateur packet.
>That's because we're in charge of our own network and can tinker with it any
>way we like. We can't do that with the network of a commercial provider. So

Yes. This is true, and needs to be exploited. Still, you have to attract Joe ApplianceOp if you want to get enough user base to support any new (or old, for that matter) system. Even repeaters and phone patches seem to me to be slowly fading, as cellphones and Personal Radio systems become more available, affordable, and efficient.

Well, one thing that comes to mind is compressed video. At 56Kbps
we can start to get something that is pretty usable. I can even
do something equivalent to the slow scan stuff at 9.6.

Another is web-style access to information.

Another is multicast of ARPS-type of information.

3626. FS: Microwave Equipment

Source record: 29038

I have for sale 4 Microwave Associates 11 GHz transceivers.

Perfect for a super high speed data link or ATV video link.

They were taken out of service approx. 3 years ago in working condition.

It should not be too hard to move them to the 10 GHz hamband.
I do have service manuals.

The equipment is rackmounted with built-in power supplies. From what I can tell the transmitters are 1 watt output. Each rackmounted unit contains a receiver and transmitter which a coupled together via wave-guide. There is a notch filter in each receiver waveguide to filter out the transmitter.

These units were originally used for video transmission and have a 6.2 and 6.8 MHz subcarrier modulator/demodulator assembles. There is a video input BNC and video output BNC on each receiver and transmitter.

I am wanting to sell all of the units together since some of the current operating freqs. are paired.

Best cash offer takes all!!
Please respond via e-mail and not this newsgroup.

Randy.

I have exactly the setup you describe. I use it for 1200 baud packet.
To use the data jack you have to set the Kantronics to high audio out
to use the data jack. It is a simple jumper change and the up side is
you can still use the mike without removing the TNC cable.

The folks running ip may choose to handle things that way,
or may choose to handle things in different ways.

Up to them to decide.

> Suggestions? Improvements?

1200 AX.25 must be supported for backward compatibility.
No big deal since this requirement will not have any effect
on the rest of the network.

> No whining. No BBS loss hand-wringing. Just do it!

What "BBS loss" ?
They will still be there, just as they are now.

Your suggestions look a lot like what we have already,
but with each site upgraded one speed notch.

But tell me about the gear we need? Who makes it?

Like it or not, Glen, there *never* has been a global amateur radio
packet network. You keep confusing a loose association of BBS
applications which happen to forward mail and bulletins over radio
with a *packet* network. A packet network can switch packets from
one end to the other. We've never had that on larger than a subregion
basis (about 8 VHF+ hops across).

That is certainly what I've been saying, since 1983.

That we should build the best network we can build, and continue
to improve it.

We have already built a global store and forward network.
What we have not built is a network with real-time connectivity.

> > ham packet will *never* reach its potential, because hams cannot and

What the wirelines have been used for, in many if not most cases,
is to bypass existing, functional, ham radio network ... often
because it was "too slow."

> It would help us to decide whether it might then be worth the time, trouble
> and effort for radio amateurs interested in global packet networking to

Those folks interested in "communication" via wirelines are not
hams, or at the least are not "taking part in ham radio."

May hams have done this, myself included (ran a dial up BBS many
years ago, had nothing whatsoever to do with my ham radio hobby.)

It is the only way we can do a "global packet switched WAN".
So perhaps a "global packet switched WAN" is not a good goal for hams.

Perhaps we need to focus on other goals, for example a "global
store and forward WAN".

Hams will still USE the internet, as they have used telephone calls
and the post office, to TALK ABOUT ham radio and to coordinate ham
radio activities.

What price might you guess that to be?

Hint: it must amortize to less than $20/month total system cost.

Thanks for the reply! Seems there is not much FlexNet going on in the US
but it sounds neat. Do you run TCP/IP on 1200 baud? Could you use a
browser like Netscape? Was wondering if it got bogged down.

I just had a short chat with Brian on the telephone asking him why the upgrade price for DSP 2.0 is $75.00. I already own a package deal from him on 2 of his programs es just wonder if anyone else feels that his upgrade price is to high. For 6 months ago when I purchased his package of DSP 1.0 es Ritty 2.0 for 170.00, each one separately was 100.00.
Now that tells me that if I had waited another six months I could have bought DSP 2.0 for 125.00, now when other software developers upgrade they have a far less markup on their upgrades or I am out of line on this part. Brian had developed excellent software es his support is great sometimes. I just thought that I would put this message out just to see if I am out of line or if other people agree. Because now it seems that I will have to spend another 75.00 if I want to take advantage of the overall improvements that he has made in DSP 2.0.
Which makes my cost of his DSP software now 175.00 instead of 125.00 if I had waited 6 months for a new version. Ian VE7IRA

> it was designed to do.

The lower level also needs to take other protocols of different packet formats. And, it should be from hop to hop. Also, doing acks and error detection/resends should be restricted to only between two points. Though TCPIP doesn't require that the lower layers use acks between points, in our low bandwidth situation, it would prevent a bad point to point transmission way down the line from causing a flood of packets from the originator. So I agree that it should be acked, but not completely linked, as that ties up the hosts performing the links.

Basically, we need a better encapsulation method than SLIP, that will carry DHCP also (it currently will not, according to its RFC). This lower level also needs a way to detect servers on the air, etc. As to transmitting ARPs and allowing reroute via this method, a more bulletproof method would be to do like RFC2002 specifies, to tunnel ips through a "care-of" server. That eliminates the possibility of two servers catching your ARP, who exist on two different nodes, unless you would like to continue to specify servers by call signs (this would provide a convenient way for ID), and guarantees that packets get to your machines address, in case some router screws up along the way.

>100ms. This is usable even for telnet.

Ok, here's the deal. If you have a direct 56 kb pt to pt link, the latency is that
of a 56 kb link (duh). But what happens if you put a switch in the middle?
The switch has to first receive the packet in its entirety at 56 kb. It then
checks it and decides where to route it. Then it sends it out again at
56 kb. Assuming the checking and routing decision time is negligible,
we're still left with the packet taking twice as long to travel end to end
as on a direct link. With me so far?

Ok, now look at a two hop link. The first hop injects a 2x delay as noted
above, *and so does the second one*. And this pair of 2x delays must be
in *series*, so total delay compared to a direct link is now 4x. This continues
on ad infinitum until you get tired of waiting for a response.

>But your point is well taken with link speeds and loss rates currently
>seen in amateur packet. BUT, if you go with multi-megabit SS links with some
>sort of FEC to get the loss rate down, more hops may still work well.

Well of course if you start out with a much higher speed, the effects of
reducing it scale equivalently. But it still doesn't take a lot of hops to get
down to ridiculously long latencies.

>presentations, RealAudio-type stuff).

Well, true. If you can deal with only UDP service, then you can get away
with this. But if you need TCP, then end to end time becomes really
important because any finite window will quickly fill before the first

ack returns from the other end, so you are at stop and wait until it does.

Well, the packet networks are so fragmented you probably miss
99.99% of the discussions going on in them. Now if we could just
tie them together into a coherent internet, that would be a different
story. You could then browse some amateur websites and come
up to speed quickly.

This newsgroup rarely gets above the "how do I wire my KPC-3 to
a HTX202?" level. But there are moments when some of the folks
working on interesting stuff will post here. The first word I had of
the Slovenian work was from a message posted here for example.
The tcp-group mail list was also a useful source of information for
a while until it turned into a NOS as BBS group (pah! what a waste).

And I'm surprised you'd even expect anything vaguely technical to
show up in QST. There have been a couple of glimmers in QEX
and Communications Quarterly, but both of them have watered
down so much recently as to no longer be worth the bother to
read. 73 has its moments, but the lack of a competent technical
editor means you can't trust most of what you read there.

>At the very least, there should be a web page that has all this stuff

Almost all of it has been covered in papers presented to the Computer
Networking Conferences. TAPR can sell you copies of the Proceedings
going all the way back to the first conference. It can be very illuminating
(and somewhat depressing too) to start at Vol I and read forward to the
present.

>with minimal investment.

Well, I suppose that if all you want to do is continue to exchange Email
and read bulletins in a quasi-uucp dialup manner, you could do that. It
doesn't have much to do with packet radio or packet networking though.
When you start getting the idea of packet networks as a distributed computing
resource, however, you see that the computers need to be able to interact
in near realtime to make it worth the effort to tie them together. The idea
is that the entire resource should be transparent. You shouldn't be able to
tell whether you're working with resources on your local machine or with
resources half the world away, or any mixture of the two. You do that on
a local ethernet now. The wired internet can almost do that now. OS's like
Inferno are designed to work that way. Etc. The web is a primitive example
of what you can do in such a distributed computing network, but there are
much more powerful ideas you can implement too.

>Except for IRC type applications, what does ham packet need "real
>time" comms for? This is a serious question.

I hope the above gives you a glimmer of a serious answer. A distributed computing resource can vastly multiply our ability to find and manipulate information over what we can do on an isolated local machine, or over what we can do with a purely push system like BBS forwarding.

>>The third way we can address the problem with amateur radio is by using

>
>If we don't show a _need_ for more HF bandwidth, there'll likely never
>be "major regulatory reform," right?

That's right, and we can never develop a showing of that need unless we have high speed LANs/MANs running applications which demand that sort of bandwidth and latency response. No one is going to hand us a blank check based on speculation of what we *might* do. We need to *show* how we'd make good use of the resource if it were made available to us. This is where using wireline wormholes can be very beneficial. It lets us develop and deploy the sorts of architectures and applications which demand such bandwidth. And it can let us say, "look, we've had to go outside amateur radio to do what we need to do because the regulations won't let us do it on amateur radio." Then we have a real case.

>>The downside as some see it is that use of wormholes negate the need for
>>alternate amateur transports. Perhaps that's true, but the availability of
>>direct dial telephones in some sense negate the need for amateur radio at all.
>
>Exactly. Cellphones and computers/Internet are competing strongly for
>most of the traditional ham tasks, and this will only get worse in the
>future.

You mean better. Once the parasitic turnkey appliance and services users move over to the commercial providers, we can get back to doing some real networking without having to be backward compatible with tin cans and string. Having to support a huge user community who can't even wire a TNC to a HT isn't a help to our efforts, it is a very major drag on our time and resources. Now that isn't meant to say that we don't have a responsibility to bring new folks up to speed, we do, but we need people who at least want to come up to speed and contribute materially to the effort.

>>But we still want to do amateur radio, and we still want to do amateur packet.
>>That's because we're in charge of our own network and can tinker with it any
>>way we like. We can't do that with the network of a commercial provider. So

>any new (or old, for that matter) system. Even repeaters and phone
>patches seem to me to be slowly fading, as cellphones and Personal
>Radio systems become more available, affordable, and efficient.

No, you don't want Joe Appliance Op. He's too cheap, and too clueless,
to contribute in any meaningful way to the network. He neither knows nor
wants to know how networking works. And he certainly isn't going to get his
hands dirty doing any of the work. But he will bitch and whine at every opportunity.
He will flame, rant, and rave every time we try to do something new and better
because it isn't backward compatible with his C64. Etc, etc, etc. At best Joe is
a test load for the system, and we can replace him with a random number
generator without much loss of generality.

The mindset that the sky will fall if we fail to prop up fading activities is
one of the more serious problems we have. We're not in competition
with Air Touch or Bellsouth Mobility. We aren't in competition with
GE Mobilenet. For God's sake we aren't in competition with America
Online. Let them have the parasites, hold their hands, and put up with
their bitching and whining. We're supposed to be an experimental service,
advancing the SOTA, not some pale imitation of a commercial utility for
the clueless.

>I can't even consider going into packet and other digital modes, because
>my computer.. a 386DX-25 Is making horrible ammounts of RFI

That is a big problem we have all had to deal with. Using ferrite devices of the proper freq on all comport cables, video cable, keyboard and mouse cables, hard drive ribbon cables will help. Opening up the power supply and adding by pass caps on the AC line will be worth the effort. Using a surge supressor that has RFI isolation was the trick here. Getting an extension for the video cable and moving the box as far away as possible also helps. I found that there was no single effort that completely eliminated the noise. It took more money than the PC is worth in ferrites.

Good luck,
Gus

How much it is on, as opposed to, how much it is off.
100% Duty Cycle means it is on all the time, 0% means
it is never on. The higher the duty cycle, the larger the
heat sink (or environmental cooling systems), for the
same power out.

3649. Help with KPC3+ and htx-242.

Hi there
I have a problem with my KPC3+ connected to a radio shack htx242 mobile transmitter. I am using Pacterm and can receive packets with no problem at all. When I try to connect to a BBS I know I can reach, the transmitter transmits, Pacterm says it is trying to connect but I can never connect. Since I have no way to monitor my transmission, I have a problem there. Do you know how I should adjust the transmit level on my KPC3+ by using the cal command. What I mean is what should the voltage be in millivolts. The htx-242 is supposed to transmit with an input voltage of 4 mv so the default of 50 mv in the KPC3+ could be too much. I really don't know. Please help me.

>>Except for IRC type applications, what does ham packet need "real
>>time" comms for? This is a serious question.

A few categories comes immediately in mind:

Anything requiring interactive person to person or person to machine communication. An IRC type application should also be able to send formatted documents, diagrams and pictures during the session, so that those participating can get quickly e.g. a circuit diagram in front of them, so that all can discuss about it.

Any www type service in which new page selections are made based on the information returned in the first page. Implementing this using e-mail that takes hours to propagate is impractical, or it would at least mean, that all data on the site should be returned in the first e-mail response. The user might be interested only in a very limited part of all that data retrieved.

Remote rig control. Tuning a remote receiver is quite problematic if you do not get real time feedback what the receiver is hearing. Currently, this would be practical for non-voice rigs only.

Any system, in which the data is less valuable the older it is. The traditional example is the DX-cluster, in which a few minutes old data is still usable, but an hour old spot is practically useless. In other applications we may be talking about seconds and not minutes.

Any system in which a single user is interested only in a very small part of the total available data. If a single user is capable at a reasonable time to get the data of interest, there is no need to transfer the whole huge available data to all sites in case some user might be interested in a small part of the data. Here in our packet bulletin forwarding system a very large number of bulletins are transferring which are in many domestic and foreign languages. Usually only those bulletins that are in English or in the same domestic language as the receiving ham speaks, will get any attention in practice (the situation might be different in areas where only one language dominates). It would be much better to store the incoming messages into a few big national or regional file servers and only have the users quickly access those articles of interest. In this way, the local systems does not need to have a huge amount of disk capacity.

True distributed data bases would also benefit from a real time network. It might be possible for each information generating point to send out their contribution once a week as a traditional bulletin and the data would have to be combined at each local receiving system. Since some bulletins might be missing and others might be weeks old it would very hard to get a coherent picture of the whole data base. The picture might be different from local site to site, since they might have different versions of the bulletins. In all, the total world wide disk space requirement would be large and all available disk space is always sooner or later consumed (speaking with decades of experience with data processing :-). With one week update cycle, some data would still be hopelessly outdated, even if all data went through to all sites. A much better approach would be to let each date producing point constantly update their own limited part of the data base. The data users could, hopefully using a unified user interface (e.g. web pages) access the data from the original source. This way, you always get a up to date information. A typical ham radio application would be the international callbook, in which each country (e.g. the national ham radio organization) would constantly update the own national data bases and all requests for that particular country would come directly from that data base. This could be even to regional or club level. When the data base updates are done at local level (e.g. by the person maintaining the membership register for the organization), there are some chances that the data would be correct and up to date. Compare this to the printed or CD-ROM international callbooks, which can contain information that is several years old even after repeated attempts by the person in question or the national organization to correct the data.

These are only a few examples and I have selected these examples mainly because the problems associated with them are familiar to most hams. There might certainly be other application in each category that might benefit more from real time access than those examples used.

>(Have the sites already ...)

If you're content with 56 kb, you can play appliance operator and
buy from PacComm and Down East Microwave. But if you want
something better, Digikey and RF Parts have most of the components
you'll need. Some assembly is required, but that's what amateurs
are supposed to do. If we just buy appliances, we might as well
be CBers or commercial service providers.

As I noted to Steve, the protocol used at the link level should be
whatever works best for that particular link. One size does not
fit all because different architectures need to be handled differently,
and terrain and other factors can dictate the best link architecture
in a particular case. There is a need for one internetworking protocol,
however, so that users can intercommunicate on a packet switched
basis regardless of the underlying link structures between them.

> one end to the other. We've never had that on larger than a subregion
> basis (about 8 VHF+ hops across).

As I mentioned earlier, those of us who got this going in the first
place
did not set a goal of a global packet switched network. That goal was
not
obtainable using ham radio. We set as a goal a global store and forward
network. That goal was reached in 1985. Perhaps it is simply not
useful
to talk about a "global packet switched network over ham radio."

The confusion in terminology is obvious: users connect to the local
services

using packet. They do not know, and probably do not care, how those services manage the store and forward.

I've used our regional network out to nearly 20 hops. Latency is terrible,
throughput is "ok" ... or at least it was until several key links went away, to be replaced by wireline connections.

Why quibble terminology? Now we know Gary's agenda ("It ain't no good unless it is a PACKET SWITCHED NETWORK"). We don't have a global one, there is zero chance we will have a global one, and as far as I can tell the users do not care. They only care about applications. If those
applications run on top of a "global packet switched network" or not is moot. They must run OVER HAM RADIO ... there are other newsgroups for wireline networks.

I would be willing to force all the ham to ham traffic of my planned radio LAN over the HF WA-sfs, if these conditions were met on the WA-sfs:

1) We could agree on a robot that would scan mail for obscene materials, which would in turn eliminate the need for any human intervention. Mail would flow automatically across all stations the rest of the way.

2) There would NOT be ANY "LID LISTS" that would cause anyones mail to be dropped, no matter how evil they are. The robot would take care of eliminating any obscene posts. As a matter of fact the robot could be designed such that when it rejects a email message for transmission that it sends it back to the sender with obsceneties x'd with some sort of tag and a warning message as to why the email was not sent. This would eliminate any station except the offender from transmitting any material that isn't fit for any transmission, and the offender some incentive to reform, that is if they would like to use the LAN.

3) You could guarantee that you would set up some type of upgrade program, to which I would gladly contribute to as long as you are reasonable, that would increase the speed of the equipment in the WA-sfs at set and planned increments. I wouldn't need this money to guarantee a TCPIP network, but a fast as heck forwarding system (no more than several minute latency from time sent from snmp server to whatever destination, whether it be a few hundred miles away or 3000 miles away, and it can be done on a sfs with a fast enough linking system).

4) You WOULD NOT panic if I also connect my TCPIP network to the internet (on the condition no email to hams participating in the WA-sfs would pass via the internet, a task easily accomplished via a lookup to qrz).

I would think this would be a reasonable tradeoff, can you accept? As I see it, you can provide bulk mail transport, but not real time tcpip packet flow, and you can get to alot of amateurs who may not have internet access, but on the other hand you can't provide services for web access, ftp, telnet, etc. and the internet can. I think this is reasonable enough that if you call it land line lid behaviour, that I would go to land lines without a second thought for all traffic, to any amateur who participates in the internet, as all reason is beyond lost in this discussion.

Anyone with an amateur radio license is a ham. Anyone who is operating a legal, licensed transmitter under Part 97 (or the non-US equivalent) is "taking part in ham radio."

Whether what they are (again, legally) transmitting is what you (or what I) would prefer they transmit has no bearing on whether they are hams or whether they are "taking part in ham radio."

> ways I can keep this noise out?

Two things I needed to do (with 3 computers and 10 radios in the
room there is much potential for interference ...)

1. Antennas are as far from the computers as possible, fed with
good coax (9913 or other 100% shield.) Getting the antennas
away from the computers made things a LOT simpler.

2. Ferrite beads on power and signal lines as required, radios,
power supplies, computers. Found that most lines were quiet,
but a few were very noisy. Lots of experimentation required.

Had one serial card that emited a great deal of noise over
the rs-232 line. Replaced it.

In the spirit of ham unco-operation (whether over ego or distance),
perhaps there should be developed a "intelligent" link layer that can
determine the best protocol in all situations. It could speed network
interconnection up by leaps and bounds, by reducing the needed level of
co-operation.

73 Magazine is on its last legs. Wayne has been wandering down the path to the paranormal at an alarming pace, and has managed to piss off most all the big advertisers. It's a sad thing, because 73 was an excellent resource in the '70s and early '80s. When Wayne dies or retires, I expect 73 will fold soon afterwards.

Looks a lot to me like a solution looking for a problem. Isn't this same argument going on in the computer world, with one faction pushing cheap computers with all the apps and most of the storage on the web, and the other faction pushing for the typical situation with most of the applications and storage on the local computer? PC's are so powerful and cheap already that I don't see why I need to be connected to dozens of other computers in real time in order to do anything meaningful.

>>Except for IRC type applications, what does ham packet need "real
>>time" comms for? This is a serious question.

I guess I see a glimmer, but I don't see an example. This may well be
something that's the best thing since sliced bread, but it's not
obvious to me, other than the challenge of doing it just for the sake
of doing it. Not that this isn't a good enough reason for a ham, I
suppose, but then, EME is a challenge, too.

>>If we don't show a _need_ for more HF bandwidth, there'll likely never

>sort of bandwidth and latency response. No one is going to hand us a

Seems to me we already have enough local and regional capacity to show
a demand for more HF bandwidth. The argument _right now_ is that we
supposedly can't move packet traffic across HF efficiently enough, so
we need to use the Internet instead. Seems to me you folks have a
very inconsistent argument here.

>blank check based on speculation of what we *might* do. We need to
>*show* how we'd make good use of the resource if it were made available

What's the difference HOW we use it, so long as it's legal? What's so
sacred about how HF is used now? It's such a vast wasteland that
anything that would be done couldn't help but be an improvement.

>to us. This is where using wireline wormholes can be very beneficial. It lets
>us develop and deploy the sorts of architectures and applications which
>demand such bandwidth. And it can let us say, "look, we've had to go outside
>amateur radio to do what we need to do because the regulations won't let us
>do it on amateur radio." Then we have a real case.

I don't see that at all. Seems like pretty shakey logic, to me. I
seem to recall that when repeaters were first developed, they were
technically in violation of the rules. After the utility and
popularity of repeaters was established, the rules were changed. And
why can't we petition for an STA? It worked to get unattended digital
operation established on HF. We're already "going outside amateur
radio" for packet links. So why isn't that enough reason to look for
regulation changes?

>>Exactly. Cellphones and computers/Internet are competing strongly for
>>most of the traditional ham tasks, and this will only get worse in the
>>future.
>
>You mean better. Once the parasitic turnkey appliance and services users

>move over to the commercial providers, we can get back to doing some real
>networking without having to be backward compatible with tin cans and string.

There's that elitist attitude again. I find that attitude to be
against all that ham radio stands for. If you really want to get rid
of "tin cans and string" then logically you should be petitioning to
have CW, RTTY, and AM banned and all those protected CW frequencies
allotted to digital techniques. Maybe those CW fossils have already
seen this possibility by reading what's being said here, and have a
legitimate worry about having their enjoyment of the hobby curtailed
in favor of your agenda.

>Having to support a huge user community who can't even wire a TNC to a HT
>isn't a help to our efforts, it is a very major drag on our time and resources.

Few, if any, of the innovators are wasting much time doing that right
now.

>Now that isn't meant to say that we don't have a responsibility to bring new
>folks up to speed, we do, but we need people who at least want to come up
>to speed and contribute materially to the effort.

If you don't have the users, you don't have any reason to have a
network in the first place, except as a place for the elite to play.

>>Yes. This is true, and needs to be exploited. Still, you have to
>>attract Joe ApplianceOp if you want to get enough user base to support
>>any new (or old, for that matter) system. Even repeaters and phone
>>patches seem to me to be slowly fading, as cellphones and Personal
>>Radio systems become more available, affordable, and efficient.
>
>No, you don't want Joe Appliance Op. He's too cheap, and too clueless,
> to contribute in any meaningful way to the network. He neither knows nor

More elitism and stereotyping. The 80/20 rule (more like 90/10 in ham
radio) means that you're never going to have a hobby/service anything
like you envision. If you do manage to chase off all the AppOps, you
won't have enough bodies left to defend our bands and privileges.

>wants to know how networking works. And he certainly isn't going to get his
>hands dirty doing any of the work. But he will bitch and whine at every opportunity.

>with Air Touch or Bellsouth Mobility. We aren't in competition with
>GE Mobilenet. For God's sake we aren't in competition with America
>Online. Let them have the parasites, hold their hands, and put up with

The hell we're not. That's exactly what ham radio is competing with. The fact that even you don't seem to be able to see this is a bit of a surprise, but then you seem to be operating in a different world than I am.

>their bitching and whining. We're supposed to be an experimental service, >advancing the SOTA, not some pale imitation of a commercial utility for >the clueless.

Sorry to break this to you, Gary, but everybody is clueless in some area. You have this vision of ham radio as a little clique of highly motivated, educated, technically inclined folks who are busy building the Next Big Thing in their basements and garages. Ham radio was never that way, and never will be that way. Ham radio's appeal is that it offers a nearly infinite number of ways to enjoy the hobby, all the way from building high-speed digital toys to collecting 10-10 numbers, ragchewing, and DXing, and yes, even ordering pizza over the autopatch.

Technology marches on, and the commercial people that you say we don't compete with are draining off hams and potential hams at an alarming rate.

You see the solution as a smaller, more focused hobby. I see one solution (probably not the ONLY solution) as an even broader hobby; one that includes a quasi-Personal Communications System as well as a cadre of experimenters and builders. That's how you get the money, activity, votes, etc, to hold on to all those valuable frequencies we're sitting on presently. The fact that even two meters is under attack by commercial interests should be a wake-up call to anybody who thinks we don't need more hams. If some large commercial interest decided that they could use six meters, for example, how long do you think we could hold it?

OK (?!)

> Like it or not, there WAS a functioning global packet network at one time,
> and it worked fairly well, all things considered.

"All things considered" is, in my opinion, a very good phrase to use,
and takes into account the variable and experimental nature of amateur
radio communications. Indeed, in these parts, there is access to quite
a reasonable worldwide AX25 PBBS store and forward mail system with
destinations reachable over a fair proportion of the globe, and which
still seems to be growing. I was quite impressed by a message from Lagos,
Nigeria, the other day !

> That competition [from the internet] is only going to get worse in the
> future. Do we want to fight 'em, join 'em, or find some other
> alternative?

I think the internet is the biggest threat going to the viability of
the amateur packet radio network, simply because there is a much greater
range of 'resource providers' of interest to the radio amateur than
are reachable via *any* packet network. Kids interested in
electronics and communication, and who were amateur radio's prime
youth recruiting ground are going to be drawn more to the internet
than ham radio on superficially presentational grounds alone.

The old adage is, of course, "if you can't beat 'em, join 'em". There
has been room in amateur radio for those whose main interests are
electronics experimentation and communication for a long time. We've
just got to get used to taking on board those whose primary interest is
communication by computer too, and proving that amateur radio has something
to offer *them* !!

> As I wrote earlier, where's the incentive for me and my friends to build
> or improve our radio system when we can do the same things and more for
> less money and a LOT less work right here on the 'net?

Beacause together you can have fun and learn from building your radio packet system. Don't just talk about it over the air. Summer is here. Have a barbeque or two. Invite your partners round as well, to keep each other company while you're talking 'boring ham stuff'. Treat ham radio as an enjoyable social activity, just like your boss regards the gold club !!

> Not to my way of thinking. It sure won't without some strong
> leadership, probably from the ARRL in cooperation with folks like TAPR
> and perhaps AMSAT.

We don't have much of a packet 'network' here, but there is a 'reasonable' one "given the circumstances" in the London area. We don't look to the RSGB DCC for 'leadership', but for facilitation, and to help us overcome (legally) some of the obstacles in our licence conditions. The network is based not on packet groups, or a grand master plan. Just BBS and node 'sysops' talking to their immediate RF neighbours, who in turn talk to their packet neighbours, ad infinitum. The personal touch can work just as well as the centrally coordinated approach. Maybe the resulting network is not as effeective as a centrally prepared one, but at least, it is there.

> Get the factions together, lock them in a room, and don't let them out
> until they agree at least on a goal and a method to achieve it. <g>

Is it white or black smoke that comes out the chimney ?? :-)

> There's more to this whole issue than just radio vs. wireline.
> We have to _use_ our bands in order to justify our occupancy.

You bet. Some big threats to us are:

1) home/business fixed telephones using radio to talk to the exchange.

2) LEO satellite mobiles.

3) Data over radio.

In the case of 1 and 3. RF is cheaper than laying cables, and I'd think that HF is rather safe from these applications.

We need to make more use of VHF and above. Packet is one way of utilising these allocations. What you, dear reader, have to decide is whether to 'encourage' the development of these VHF and up LANS and MANS by perhaps interlinking them via the wires.

Cheers,

Gareth.

In <33aeb4b1.17740157@news.atl.bellsouth.net> ke4zv@bellsouth.net (Gary Coffman) writes:

>Ok, now look at a two hop link. The first hop injects a 2x delay as noted
>above, *and so does the second one*. And this pair of 2x delays must be
>in *series*, so total delay compared to a direct link is now 4x. This continues
>on ad infinitum until you get tired of waiting for a response.

Hum? Lets look at the example of a 56Kbps link and a 1k byte packet.
Ignore swiching time, header overhad, etc. A direct path takes 140ms,
one hop takes 280, two hops takes 420, three hops takes 560ms...
The transit time is n*140ms + 140ms, where n is the nubmer of hops. This
is linear not exponential (which is what a doubling per hop would be).

If we increase the link speed by an order of magnitude (only half
a megabit) latencies are correspondingly lower by an order of magnitude.
If you build your metro area backbone out of megabit lines (which
seems in the relm of possiblity if a bit ambitious) then quite deep
networks are still quite useful.

>Well, true. If you can deal with only UDP service, then you can get away
>with this. But if you need TCP, then end to end time becomes really
>important because any finite window will quickly fill before the first
>ack returns from the other end, so you are at stop and wait until it
>does.

Most modern TCPs can handle RTTs of in the order of a second or so. If we
assume a maximum window size of 16Kbytes (not particulary large. I think a
Sun can be configured to use the full 16 bits / 64K of window) at 58Kbps you
could send go for over 2 seconds before you need to see an ACK. The pipe
will stay full fine. Now with a bit of hand waving, your 8 hop number still
makes sense at 56Kbps. But, we use megabit links then quite deep networks
can be built.

Now all the above assumes unloaded links, but I am a but rusty and rushed
right now to write up a complete analysis of loaded/congested links for TCP.
To over simplify greatly, if everyone is doing long lifetime connections and
filing up the megabit link (say to the point where each connections fair
share is 56Kbps) then you are more or less back to where you started (But
this is ok, as these long lifetime connections are bulk transfers and not
latency sensitive). If you assume that many of the users are doing quick
single or small number of RT packet operations (e.g., telnet or many web
accesses) then the average RTT time for each connection is low (since stat
muxing keeps them out of the queues at the same time). You may run in to
problems in with mixed interactive and bulk traffic, but there are ways to
fix this that I won't go in to now (That don't involve strictly FIFO queueing
e.g., We are developing PPP extensions for a mix of interactive video and

bulk traffic).

(I rushed this out a bit, but I sure someone will tell me if I got it wrong or spaced totally :-))

We've discussed the reasons for this in previous threads. Suffice it to say that you DID (eventually) find the information you sought on the Internet (you connected with individuals posessing the knowlege you claim to seek), in an Internet discussion group, not on the AX.25 PBBS System- 'nuff said.

That it's not mentioned in QST or 73 is hardly surprising. The two best periodicals for finding out about advanced Amateur networking, in my opinion, are TAPR's Packet Status Register newsletter (quarterly) and CQ-VHF magazine (monthly).

The "stuff" you refer to is available on the TAPR Web site, both from info hosted directly and the abundance of links relevant to Amateur Packet Radio. http//www.tapr.org is probably the single best site of packet radio releated information on the Internet. TAPR sells the Proceedings of previous ARRL Digital Communications Conference. TAPR took them off the ARRL's hands just in time to prevent them from being turned into more landfill. The ARRL didn't want to keep them in stock because they didn't sell fast enough compared to other publications. The DCC Proceedings are excellent reference material for anyone genuinely interested in higher speed packet radio. The table of contents of each Proceeding is available online, but the actual article is not- you'll have to buy the book to read the article. All sorts of articles about high speed (56K) packet are in there- the original article on the WA4DSY modem, the updated WA4DSY modem, considerations on operating a 56K MAN, and with some work, an article in the 1997 DCC Proceedings about the Vancouver BC MAN that makes use of two (now) or three (soon) 56K UHF repeaters.

> At the very least, there should be a web page that has all this stuff
> available in a format usable by someone of average abilities, and it
> should be well advertised. I suspect that some of it may be on the
> TAPR site, but if it is, it hasn't been publicized well enough.

TAPR does the best it can with the limited manpower available to it. It's relatively efficient to post information to r.r.a.d.m. and mailing lists, but not to AX.25 PBBS'... 'nuff said.

Abundant information on Higher Speed Packet Radio and RF-based networking IS out there, and those willing to do a bit of research on their own will find it. It's unrealistic to expect it to come to you.

3669. TAPR TAC-2 (Totally Accurate Clock)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-24 00:00:00 UTC
From: Steve Stroh <strohs@halcyon.com>
Message-ID: <Pine.ULT.3.96.970624173858.14682E-100000@coho.halcyon.com>
Source record: 28984

TAPR TAC-2 (Totally Accurate Clock)
http://www.tapr.org/tapr/html/tac2.html

It is with considerable pleasure that TAPR can announce that version 2 of "Totally Accurate Clock" (TAC-2) is now available in kit form. TAPR has been working with Tom Clark, W3IWI, to make an improved version of the TAC available to all. TAC-2 Rev.C of the kit is now available from TAPR.

The "Totally Accurate Clock" TAC-2 kit is intended to serve several purposes:

* It provides a "universal" electrical and mechanical interface for a number of common OEM board-level GPS receivers including specifically:
o Garmin GPS-20
o Motorola Oncore
o Trimble SK8
* It provides interfaces for the 1 pulse-per-second (1PPS) signal generated by these receivers:
o Low-impedance, fast rise-time 1PPS signals for "laboratory" applications.
o RS232 level 1PPS signals for computer applications.
o Specialized 1PPS interfaces for an add-on PCB that will stabilize a low-cost crystal oscillator to an accuracy ~ 1 part-per-billion
* It provides several different power supply options to make use of your GPS receiver easier. The power interface is similar to (and compatible with) those used for computer disk drives:
o A low-cost, (7805-type) regulator.
o A high-efficiency switching power supply.
o Direct 5 volt power.
* It has provision for an Uninterruptable Power Supply (UPS) to buffer the GPS receiver through brief power outages.
* It provides Battery Backup so the GPS receiver can wake up "smart."
* It can provide isolated power for an amplified GPS antenna.

Since the TAC-2 has so much flexibility, there are several options you will have to choose from during construction. The "base" implementation will satisfy the needs of many radio amateurs with support for the Garmin GPS-20 and Motorola ONCORE Basic receivers. A few jumper changes enable support for the Motorola ONCORE VP/UT receiver. Some added parts and some more jumper changes are needed if you plan to use a Trimble SK-8.

The TAC-2 is offered as a kit which will take approxiamtely 2 or 3 hours to build.

The TAC-2 kit has been designed to be very easy to assemble. TAPR supplies detailed "Heathkit-like" instructions that only require you to know which end of the soldering iron is hot and a little knowledge on how to put things together!

One of the major interests that TAPR has in GPS timing is in the use of GPS as a way to steer ("discipline") an oscillator. By tying together a low-cost crystal oscillator and a GPS receiver, it is possible to have a Rubidium-class (better than one part per billion) frequency standard. The TAC-2 has been designed to support this function and the TAC-2 project team is working on developing the "TOC" (TAC Oscillator Controller). The plan is that the TOC will plug directly into the TAC-2 circuit board. More information on this project will be made available as progress is made. No time is set for delivery of this daughterboard at this time.

General Information

The price is:
$125.00 US for members of TAPR
or
$139.00 US for non-members

plus shipping and handling (see below).

and will include:

* TAC-2 Rev C PCB Board
* All necessary parts for the TAC-2 to allow interface to either the Oncore VP or Garmin GPS-20
* Documentation

Please note: This is not an enclosed unit. Enclosures are being worked on, but will not be availble until the fall.

If you would like to order one of these units, you can

e-mail tapr@tapr.org,
phone (940) 383-0000,
fax (940) 566-2544.

or use the on-line TAPR Order form.

Office Hours: Tuesday - Friday 9am - 12pm, 3pm - 5pm Central Time

Questions concerning the unit and details on the buy will be handled on the TAPR GPS Special Interest Group list.

Shipping and Handling

* Shipping and Handling within the US will be $5.00 US by UPS Ground unless otherwise requested by purchaser.

* International Shipping will need to contact the TAPR office and get a quote on the shipping to your country. TAPR uses International Express Mail, unless the purchaser requires something else.

What changes where made between the version 1 and version 2 designs

* The circuitry has been improved in a number of areas:
o better low-Z 1PPS buffers.
o better RS232 drivers.
o full "Plug 'n Play" support for any of the Motorola ONCORE receivers (the original PVT-6/BASIC, the 8-channel VP or the new UT-series) and several other receivers as well.

* A number of power supply options have been provided, including
o the TAC-2 can look like a "disk drive" when mounted in a PC
o an optional high-efficiency switching power supply
o an UPS (uninterruptable power supply) capability (good for a few minutes)
o an optional regulator for external antenna bias
o several BBRAM "keep alive" power options, etc.

* The off-board connections for the original TAC were all soldered wires. On the TAC-2, we made extensive use of IDC ("crimp-on") connectors for ease of assembly and reliability.

* The ONLY significant deletions from the original TAC are:
o the on-board MMIC L-band RF amplifier.
o The original GSFC-supplied TACs were in a metal box (we used off-the-shelf RS232 "A/B" switch boxes). The TAPR TAC-2 is a kit-form circuit board. You have to provide your own mechanical mounting (for the time being).
o An A/B switch box would work fine as a mounting. Another possibility is that the TAC-2 circuit boards are about the size of a small computer disk drive and the power connection is the same as on a disk drive. TAPR is planning a mounting that would put the TAC-2 in a disk drive bay inside your PC.

Totally Accurate Clock (TAC)

Excerpts from TOTALLY ACCURATE CLOCK ANNOUNCEMENT, Tom Clark, NASA/GSFC (February 2, 1995)

The "TAC" name is supposed to invoke a smile on your face. Many of you remember Heathkit's "Most Accurate Clock" (a WWV receiver) and I see advertisements for VLF clocks (WWVB in USA, DCF77 in Europe) that still use the "Most Accurate Clock" name in their advertising. Since the "TAC" is 3-4 orders of magnitude better than the "Most Accurate Clock" units, the "Totally" name seems warranted (also, TAC are my initials and this was begun as a home project!).

The TAC project began when I was on sabbatical at Onsala when Bernt Ronnang got me an early prototype of a Motorola PVT-6 OEM GPS receiver. In that incarnation, the PVT-6 was pretty disappointing. When I got back home, I had Motorola update the internal firmware and found that its personality had changed completely -- it was now very precise, but it had about a 500 nsec bias. I contacted a friend at Motorola who was involved in the PVT-6 software and he told me that tests at USNO had uncovered the same error. I was added to the "beta" group, got my initial prototype updated with the latest firmware and began more detailed testing. What I then found was that the PVT-6 receiver had the best timing performance I have seen in any small GPS receiver. With a small amount of care in setting it up, it now gives 50 nsec or better RMS timing precision and biases appear to be < 20 nsec.

The TAC project now involves both hardware and software. Let me briefly describe both to you.

HARDWARE:

The core of the TAC consists of a GPS. Several are going to be supported in the TAC-2 design (Motorola ONCORE, Garmin GPS-20, Trimble SK-8) The circuit board allows these various GPS to be mounted to the board.

The TAC-2 adds a number of desirable features:

* The 1 PPS output signals are buffered through a 74AC04 gate to improve the drive capabilities and to act as a "fuse" to prevent damage to the receiver in case of an operator goof. Up to three independent buffered outputs are provided, and the buffers will drive about +2 to +2.5 volts into a 50 ohm termination. The normal logic polarity is positive going at the epoch time, but this can be inverted if desired by some simple jumpers.

* Up to three open collector 1PPS signals are also available, negative going. Normally these would be used to drive display LEDs, but they can be used for other purposes.

* The add-on board includes an RS232 driver that provides 1 PPS time synchronization to an attached computer. The 1 PPS signal is normally connected to the computer's DCD input.

* The RS232 I/O to the computer is buffered and isolated from the receiver to act as a "fuse" to prevent damage to the expensive receiver in case of an operator goof. An RS232 OR-gate is supplied for the receiver input signal to allow RTCM SC104 Differential GPS signals to be fed to the GPS receiver.

SOFTWARE:

A program called SHOWTIME displays the current time in BIG DIGITS you can see from across the room. In addition to just showing the UTC time, it includes a display of the date, day-of-week, day-of-year, local and

Greenwich Mean Sidereal times, JD and MJD, and even the current GPS week. You can enable audible "WWV-like" time ticks to assist you in setting the formatter (or your wrist-watch). You can have the software automatically reset the PC's internal clock with about 25 msec accuracy. All the time display updates and audible ticks happen synchronously with the GPS 1 PPS signal because the PC reads the tick on its DCD line.

SHOWTIME allows you enter timing offsets and handles all the arithmetic for you. It allows you to make easy corrections for time delays in cables and the instrument and it tells you (with 1 nsec resolution) the actual epoch of the 1PPS tick and it gives you an estimate of the accuracy of the tick. SHOWTIME gives you a nice display of which satellites you using and which satellites are above the horizon. This includes a bar-graph "S- meter" for each of the GPS satellites currently in lock which are updated once per second.

The software lets you change operating modes (timing vs. position, elevation masks, satellite selection criteria, etc) easily and when you are running in position-determination mode, it will handle all the position averaging tasks for you. At any time, you can save the current configuration (positions, timing offsets, receiver modes, etc) to a disk file and restore that configuration at a later time.

At this time SHOWTIME runs stand-alone on a separate MS-DOS PC (but it does seem to run OK in the DesqView multitasker). Once you have set parameters into the GPS receiver, the PC operations can be terminated.

> alt.law-Enforcement
Duty cycle ia usually expressed in percentages over a specified time...
An example is 50% at 5 minutes...which means the power supply can
provide full output for 2 1/2 minutes if you remove the load for the
next 2 1/2 minutes to allow for cooling...Continuous duty cycle means
that a power supply or amplifier will supply it's full rated output over
a continuous period such as broadcast stations that stay on for 24 hours
a day...

It is a good goal for hams who are interested in working with packet switched
networking.

>Perhaps we need to focus on other goals, for example a "global
>store and forward WAN".

That's already been done, over a decade ago as you've said yourself. We
pushed that idea as far as was reasonable and discovered it to be an extremely
limited and limiting paradigm. It had its day, now it is time to go beyond that idea
and link our disjoint LANs together on a true packet switched basis.

We can do that today. The tools are now available to us. Not all of them meet your
religious purity test, but we don't have to limit ourselves just to satisfy your religion.
If it makes sense to use wormholes for some of the long distance links needed
to internet our disjoint LANs with low latency, and it does, then we can and should

do that. Just because we have a hammer doesn't mean that every task must be viewed as a nail. A good worker uses the right tool for each job.

3674. X-based apps w/jnos & tnos

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-25 00:00:00 UTC
From: jackson@net1plus.com
Message-ID: <5oqtfl$1o6$1@usenet88.supernews.com>
Source record: 28914

Has anyone had any luck running x-windows based
apps (ftp client, browser, etc...) with jnos or
tnos under linux? I have the kernel and nos talking
just fine, and I can send and recieve. Just can't seem
to get directory listings displayed correctly, if at
all. I have a feeling it's because the switch I'm
talking to is running jnos for dos, and doesn't
understand the 'ls' command, which is what I think
all the linux based apps use for directory listings.
Thanks for your time.

3677. Use of public key encryption for authentication

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-25 00:00:00 UTC
From: hoffman@eng.sun.com
Message-ID: <hoffman.867197411@eng.sun.com>
Source record: 28985

Some one mentioned the use of ssh as a way to tunnel net 44
traffic over the internet. I would probably do that with GRE
instead, but that is another story.

My question is this:

Does Part 97 prohibit use of public key encryption
as a mechanism for >authentication<.

The usual way it works (this is more or less what ssh does) is as follows:
Node A wishes to authenticate itself to Node B (say to log in to it or
control it). Node B generates a random number and encrypts it using Node A's
public key (which is made available to the world through some TBD key
distribution mechanism), then sends this to Node A. Node A then uses its
private key for that pair to decrypt the number and send it back to B. If it
matches the number that B orginally generated then B knows that A is who he
says he his (since he is the only one who would know the secret key to
decrypt the number). I am now able to log in without ever sending a secret
password in the clear. Similar things are done to avoid "man-in-the-middle"
attacks.

Anway, we are just encrypting a random number, not any actual user data
(which would still go in the clear). It would seem that this is morally
eqivalent to the authentication codes used to control remote repeaters (but
more secure).

Any comments one way or the other?

Don Hoffman (KC7YJA)

3678. 9600 baud using MFJ data radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-25 00:00:00 UTC
From: ajraich@ajraich.clark.net
Message-ID: <slrn5r0r11.cu.ajraich@ajraich.clark.net>
Source record: 28986

HI:

I found the only other person in the Baltimore Washington area
that seems intersted in packet radio. :-) We decided to setup a
point to point link using 9600 baud on 145.01 to try to experiment with
it.

We both are using MFJ data radios. The antennas are a pair
of 2M beams (16db gain) on one end, and a J pole on the other end.
The distance between stations is only 5 miles of relatively flat
land near water.

The problem we have is a horrable Bit Error rate! We find
that at best, we are getting 2 out of every 3 packets through! This
greatly impacts link speed, and gives us a net data rate that is
slower than 1200 baud!

So are there any hints about what we can do to improve
net throughput? We obtained a tuning proceadure for these radios,
but have sofar made things worst. Anyone have any suggestions of
what we can do to improve the radios? Any mods? QST claims that
a preamp would help... Has anyone used one with these radios?

Perfectly legal. A couple papers on this were published in the old
Digital Conference Proceedings. I think it drove Phil Karn to write a
software DES, which then later caused him to legally battle the U.S.
Government. Through some convoluted reasoning, the U.S. Government
decided it was OK to sell a book with a DES algorithm on a floppy, but
that a fully functional DES program on a floppy was a crime. Go figure...

Anyway, the world solved this problem quite effectively with PGP and Idea.

> Any comments one way or the other?

Authentication will be an important part of packet radio, if it doesn't die
first. There is no need for authentication if only 10 people in the world have
a node.

Steve

I work for an oil exploration company in South Africa. I do not know much about We use a packet radio system supplied by Scientific Radio Systems, Inc from Rochester, NY. It is based on a SR-812 modem, SR-370 Transceiver and is controlled by a software package that runs on top of DESQview (by Quaterdeck??).

Because of the specific configuration, we have until now been looking upon this system as a "black box". I would however like to connect this system to our Windows NT network using TCP/IP or NETBUI preferably under Windows 95.

Can I get software to connect to the network that also runs on top of DESQview or can one get Packet radio program for Windows that can communicate with the SR-812 modem? Any responses to my e-mail <dirkn@soekor.co.za> would be appreciated.

Thanks

Agree about person to person. Do not agree about person to machine.
Think distributed and replicated applications (WP servers were the
first operative example.) The human connects with a local machine
which provides the same services (distributed and/or replicated) as
the distant machine would provide.

>

> you do not get real time feedback what the receiver is hearing.
> Currently, this would be practical for non-voice rigs only.

One application which would also work well with replication
(the radio would be local then.)

This has not been my experience. I have users who read (and post)
in Russian, German, Dutch and Spanish. Might be a few more languages,
but those four, along with English, appear to be in common use here.

> True distributed data bases would also benefit from a real time

But "false" distributed databases would not?
I'm confused by your terminology.
There are many flavors of replication ...

The next question we might ask is: "What do the users want?"

In my view the marketing questions must be answered before we
begin any engineering design.

Thank you Jon. Exactly my point.
When hams use "wirelines" they are not transmitting.
The "what" they are not transmitting is immaterial.

My only quarrel with Linux is that Corel doesn't support it currently. I haven't tried applixware, yet, though, so who knows? I wish Corel and several other companies would take notice of the uprising occuring around Linux, and start developing software for it. But instead, they continue writing only for MSW95/NT (I am not advocating they stop, that would be business suicide). Though NT is a well written OS, in terms of commercial non-unix-OSs, it still doesn't approach the stability of most unix's, in particular Linux's.

For a demonstration of NT's so called rock solid performance, open real audio encoder, then select a 70 meg sample (stereo, 44100Hz). Wait ten seconds, and watch your BIOS do a self check, and that is with 128MB of RAM. So much for OS/user/driver separation, which in my book, seriously jepordizes NT's claim to be a reliable high load bearing server platform, if it can't handle a simple signal processing program on a single user, unconnected-to-network machine, with gobs of RAM.

With my knowledge of Novell, NT, and Linux, I can no longer look at PC-Magazines pick of NT as the top network server OS, as anything but blatant advertising for MS. Of course, isn't that what PC Magazine does best for both MS and Intel?

The goal of a BBS forwarding network was, as you note, accomplished in 1985.
That goal was satisfied, now it is time to set new goals and accomplish better
things.

>Perhaps it is simply not useful to talk about a "global packet switched network over ham
radio."

It is useful to talk about it, but that goal is not obtainable today with a *pure*
all amateur radio network, though it may be at some indeterminate future time.
But we need not let that bother us. We can do the parts that are feasible today
by amateur radio, and the parts which aren't by wireline. There's absolutely nothing
wrong with that. It's just good engineering practice to use the right tool for each
part of a job. Just because we have a hammer, doesn't mean every job must be
a nail. Sometimes we should bring in a screwdriver too.

>The confusion in terminology is obvious: users connect to the local
>services using packet. They do not know, and probably do not care,
>how those services manage the store and forward.

That's true. Parts of the transport could be over wireline and it would
make absolutely no difference to the users. In fact if it is done right,
it should be totally transparent to them.

>I've used our regional network out to nearly 20 hops. Latency is
>terrible, throughput is "ok" ... or at least it was until several key links went
>away, to be replaced by wireline connections.

Hmm. Are you saying that throughput declined or latency got worse when
some of the radio links were replaced by wirelines? If that's true, then I'd
have to agree that isn't good. Sounds like it wasn't a well integrated design.

>Why quibble terminology? Now we know Gary's agenda ("It ain't no good
>unless it is a PACKET SWITCHED NETWORK"). We don't have a global one,
>there is zero chance we will have a global one, and as far as I can
>tell the users do not care. They only care about applications. If those
>applications run on top of a "global packet switched network" or not
>is moot.

It's true, the users only care about applications. If the network, whatever it
is, supports the applications they want to run, then they don't care about the
details beyond their local loop. But the details do matter to those writing
applications in so far as the nature of the internetwork services dictate
what the application can and cannot do. If throughput is high and latency
low, much better applications can be written and run than if the networks
are disjoint and can only have the equivalent of dialup uucp batch transport
between them.

>They must run OVER HAM RADIO ... there are other newsgroups
>for wireline networks.

Well, that is *your* religion. There is no logical reason to avoid integrating the
two different transport mechanisms where it makes sound engineering sense to
do so. They can be highly complementary to each other and allow us to do things
which we couldn't do with either one alone.

One of the purposes of hop by hop acknowledgements is to gain an
immediate metric for link quality. This can be fed back up the stack
in the switch to allow it to make more intelligent routing choices on
a packet by packet basis. This is essential to the ability of the network
to load level and self-heal.

We have the primitive RIP mechanism, and a method to determine the
shortest path already. The problem is, the shortest path isn't always the
best path. That's where dynamic quality metrics can be very useful. Ideally,
we want to keep as little state information around as we can, and we don't
want to depend on fixed servers any more than we have to. The network
should be able to heuristically discover and use routes as they become
available in as transparent a manner as possible.

3700. Analysis/Synthesis Capability for Hams

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-25 00:00:00 UTC
From: Kathy Goerg <kgoerg@webblabs.com>
Message-ID: <33B18C4A.79D@webblabs.com>
Source record: 29008
Cross-posted to: rec.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radioamateur..misc,rec.radio.amateur.space

Many amateur radio operators have contaced us in recent months regarding availability of affordable electronic analysis and synthesis tools. We have now released Version 2 of the Professional Partnership (PP) Program. While there is a one-time $975 charge, the PP program may be distributed throughout a club, organization or company. Of special significance is the profound level of Wireless/RF/Microwave capability included.

The PP Program includes:

Nodal Circuit Analysis with True Two-Node Port Definition
Unconstrained Noise Analysis
Transmission Structure Synthesis & Analysis
Over 40 Single & Coupled Topologies
Strip (Planar) Structures
Wire Lines
Coaxial Arrangements
Waveguide (Non-TEM) Topologies
Passive Filter Synthesis
Lowpass
Highpass
Bandpass
Prototypes
Practical Reactively-Coupled Realizations
System & Receiver Design Support
Link, Terminal & Radar Analysis
System Architecture Characterization
Spurious Analysis
Transmit & Receive
Coincident & Tuned
Preselector & Output Filtering
Phase Noise Analysis
Time Domain Effects
Frequency Domain Effects

500+ Page User's Manual with Examples & References

Acquire a single PP Program package for your club, company or organization, and you will be furnishing all of this needed capability to every designer, not just one! Our competitors are furious with us for having created the uniquely progressive opportunity. It seems they're still using dongles to hinder access to their own products.

Please contact me for additional information.

Kathy Goerg
Professional Partnership Program Coordinator

I still do not understand how this will resolve problems caused by two well-heard servers, and easily contactable servers in the same area on the same frequency. ARP will not resolve the fact that there are two sources of the same packet. Plus, it seems the error detection layer should determine link quality at the servers that are providing services.

With two packets coming in over ARP, to routers up stream that determine which servers should get the ip packet meant for your machine to route on the air, the link that is the slowest will have the effect of securing service to your machine because it will be the last to the router. Trying to program the router for these cases would be something akind to future prediction, if the are more than two servers.

RFC2002 tunnels tcpip packets over a tcpip network, and places one server into a care-of type of mode. It receives the packets meant for you from your home area router-server that your home server had received, strips out the packet meant for you, and routes it onto the air. This seems like a much more reliable method than the ARP metrics you mention.

I still do not understand how this will resolve problems caused by two well-heard servers, and easily contactable servers in the same area on the same frequency. ARP will not resolve the fact that there are two sources of the same packet. Plus, it seems the error detection layer should determine link quality at the servers that are providing services.

With two packets coming in over ARP, to routers up stream that determine which servers should get the ip packet meant for your machine to route on the air, the link that is the slowest will have the effect of securing service to your machine because it will be the last to the router. Trying to program the router for these cases would be something akind to future prediction, if the are more than two servers.

RFC2002 tunnels tcpip packets over a tcpip network, and places one server into a care-of type of mode. It receives the packets meant for you from your home area router-server that your home server had received, strips out the packet meant for you, and routes it onto the air. This seems like a much more reliable method than the ARP metrics you mention.

Dear Julian,

This is an answer for your two problem's (home and office).

1. Regarding the problem with Repeater Link software is known to us,

We will fix it on the next version of IPHONE.

2. You can download a NORMAL IPHONE at: www.vocaltec.com

Sincerely,
Avi Pardo
VocalTec Tech Support.

But if they are transmitting, they're hams taking part in ham radio,
right? Even if what they are transmiting is store-and-forward messages
that were relayed via wireline from other amateur stations.

>a preamp would help... Has anyone used one with these radios?

Take your scope and look at the received eye patterns. I expect you'll
find them distorted at top and bottom. That's an indication of excessive
deviation, or radio IFs which aren't properly aligned. The first thing I'd
try is to reduce the deviation until I got a clean eye pattern. If that results
in deviation of less than 3 kHz, then I'd get out the sweep generator and
realign the receiver IF to have a sufficient passband response.

If you see distortion in the eye down near zero crossing, you're probably
suffering from multipath. In that case, you need to work with antennas to
try to minimize it. Try a pair of beams for your link, or move your omni
antennas around to get out of the multipath zone. Moving one end even
a couple of feet can often reduce multipath enough to make a path usable.

Another thing to check is that you're running adequate TxD to allow the
radios to switch and stablize. Go to a long Txd, 500 mS, and see if your
error rate goes down. If it does, you need to work on the TR recovery time
of the radios. You should be able to get it down to 5 to 10 mS.

>shops at that time either...

Well, Billy was a psychopathic low grade moron, so we'd expect him to only be
able to use a turnkey solution. Hopefully amateurs are a bit more competent.

The principle of the blowback mechanism on which subguns are based was known in
Billy's time. Take a look at an Ingram or a M3 grease gun. They are very simple mechanisms
which can be fabricated quickly and cheaply, even with hand tools. A competent worker could
have assembled one at any time after the Civil War brought metallic cartridges to a
suitable
level of development.

The main reason subguns waited until near the end of WWII to come into use isn't
technological, it is logistic. A foot soldier couldn't carry enough ammo to keep a
buzzgun fed in combat. With the advent of mechanized resupply, that problem
eased enough that buzzguns are now de rigeur. The first thing we called for at
the start of a fire fight in Nam was ammo resupply choppers. Then we'd call
in artillery and air strikes. If we didn't do it in that order, we might well be down
to wielding bayonets before the battle was over.

The Ottawa group has used the original WA4DSY RF modem at 128 kb.
The modification is simple. But keeping it fed can be hard. The PI card
can do it, but you need a fairly competent PC to host it (minimum a 386SX).
Fortunately, they're cheap.

Barry McClaren has a high speed packet page. A number of others also
provide pages for various facets of advanced networking. Many of these
cross reference each other. If you haven't found them, you haven't been
looking very hard.

>>Almost all of it has been covered in papers presented to the Computer

Anyone interested in amateur packet networking should have. It has been the
primary place where all the advanced work that's being done by radio amateurs
has been reported for almost two decades.

>>TAPR can sell you copies of the Proceedings
>
>Sell? Why should I have to buy stuff that could be posted on the net,
>at least in summary?

TAPR does have some of the most recent conference presentations in Real
Audio format on their page. The older stuff is only available on paper. Sales of
the Proceedings is what finances the conferences.

No, this has nothing to do with diskless workstations. Consider the web
as a model of a distributed computing resource. You were lamenting
above having to buy the Computer Networking Proceedings. You wanted
them on the web. Well that requires computers interconnected in near
realtime. Distributed computing frees you from having to obtain media
and keep information locally on your machine. You can access it from
the source at need. Not only is that more convienent and cheaper, it
also allows the information you access to be up to date and authoritative
because it is maintained by the source of the information.

Paul offered a good list of amateur applications which would benefit
from a realtime distributed network. They only scratch the surface,
however, since most of the things we can do with a distributed network
resource are things we haven't even tried to do in the past because

the current amateur network is disjoint and (mostly) very slow.

>very inconsistent argument here.

Hardly. We haven't begun to deploy applications which could make good
use of a global packet switched WAN. There are bits and pieces of what
we could do scatttered in a number of disjoint LANs, but until we can tie
them together, we have no legitimate traffic demand that would justify
a rules change request.

>>blank check based on speculation of what we *might* do. We need to

>anything that would be done couldn't help but be an improvement.

Well, that's your judgement (and to an extent it is mine as well), but we
have to do better than that to justify asking for a bigger slice of it. The
other users have a right to access too. We might not think that their
usage is very worthy, but then they might say the same about ours.
We need to make a *compelling* case for better access, and not just
demand it because we can.

>>to us. This is where using wireline wormholes can be very beneficial. It lets

>why can't we petition for an STA? It worked to get unattended digital
>operation established on HF. We're already "going outside amateur
>radio" for packet links. So why isn't that enough reason to look for
>regulation changes?

Because the little that we do today is not compelling enough to make it
obvious to others that we need more capacity. The political reality is

that to get a rule change we need to convince the FCC our usage meets
charter goals, and we have to have general support from the larger
amateur community that what we are doing is worthwhile enough for
them to make a bit more room for us.

Note that we can't really exploit distributed network resources unless we
have enough resources deployed and internetted to make it worthwhile
to do so. An STA won't cut it, and bootlegging certainly won't. We have
to establish distributed networking on a fairly large scale to make its
benefits apparent to those who don't fully understand the paradigm we're
trying to deploy.

>>>Exactly. Cellphones and computers/Internet are competing strongly for
>>>most of the traditional ham tasks, and this will only get worse in the
>>>future.
>>
>>You mean better. Once the parasitic turnkey appliance and services users

>>networking without having to be backward compatible with tin cans and string.
>
>There's that elitist attitude again. I find that attitude to be
>against all that ham radio stands for.

If it is elitism to want to fullfill the service's charter goals, then I'm guilty.
It is the free ride parasites who aren't living up to the service's purposes.
They would be better served by using a commercial utility's services.
Amateur radio isn't supposed to be a common carrier for the masses.

>If you really want to get rid

Well, there aren't currently any protected CW frequencies, except for
50.0-50.1 and 144.0-144.1 MHz. HF is divided into data and voice/image
segments now. That's a satisfactory arrangement. What isn't satisfactory
is the speed and bandwidth limitations imposed on us by regulation.

>>Having to support a huge user community who can't even wire a TNC to a HT
>>isn't a help to our efforts, it is a very major drag on our time and resources.
>
>Few, if any, of the innovators are wasting much time doing that right
>now.

Nonsense. Virtually every network builder I know spends at least half his
time dealing with support issues from users. Part of that is necessary
feedback, the users are the test loads on the system, but much of it isn't.
Much of it is because the users are lazy and don't have the initative to
seek out the answers from the available literature. GRAPES published

a user's manual for its network. The answers to 90% of the questions we get are in that manual, or in the manual that came with the users' equipment. But the users can't be bothered to read or understand that information. The 10% residue is so important, however, that we have to accept all the support calls, otherwise we wouldn't find the real bugs in the network. And there are always real bugs to be found.

>>Now that isn't meant to say that we don't have a responsibility to bring new

>
>If you don't have the users, you don't have any reason to have a
>network in the first place, except as a place for the elite to play.

You mean except as a place for those fullfilling the charter goals of the amateur service. If you want to call those people elite, I won't argue with that. After all, it is the elite who accomplish things. There should be more of them, and fewer of the obstinately clueless parasites who just want to use the work of others while whining and complaining about the direction and scope of that work.

>>>Yes. This is true, and needs to be exploited. Still, you have to

>won't have enough bodies left to defend our bands and privileges.

We can't defend our spectrum with mere numbers. If we aren't using it to good purpose, squatters don't matter much. It is true that the safest spectrum of all is the 27 MHz area. But that isn't because of the numbers operating there. It is because of the number *who wouldn't leave* if the spectrum were reallocated to a better use. Hams have a long record of vacating spectrum when they are told to do so. That's because they have respect for law. Now if you want to save amateur radio by making it a lawless activity, you might succeed, but I wonder if that matters.

>>The mindset that the sky will fall if we fail to prop up fading activities is

Sure people can do all that. I hope they have fun. But it isn't our job to provide them common carrier services to do it. We aren't a public utility trying to maximize billable minutes. You seem to think we are. You seem to think we're in competition with America Online, but we are not. Not only is that illegal, it isn't what amateur radio is about.

The sort of people we want to attract to packet networking are those who really want to do packet networking because it is interesting and challenging to them. We need people who want to learn and contribute. If all they want is to order a pizza, let them use a cellphone, or their CB, or join a 2m autopatch club. If they want to chase Dx, let them fire up the DX-40 and beep away. If they just want to download dirty pictures from the web, or flame in a newsgroup, let them pay AOL. Just because what they want to do may be (dubiously) legal under amateur rules, doesn't mean we have to encourage or support it in our subset of amateur radio.

The experience in this part of the US is that once things are linked
by wires, the RF network goes away. The wires are faster, cheaper,
and you can do things with them which are illegal to do over radio.

No, Part 97 does not prohibit that sort of usage. In fact, in the automatic
forwarding action, the FCC said that provision of authentication would
relieve forwarders of responsibility for the material that they forward
for others.

You're assuming a quiet link. Fill the pipe and recalculate. Each hop
effectively halves the speed of the total path, which also effectively
doubles latency.

Well, yes, there has. You just have a narrow, restricted definition
of the word "network."

>applications which happen to forward mail and bulletins over radio
>with a *packet* network. A packet network can switch packets from
>one end to the other. We've never had that on larger than a subregion
>basis (about 8 VHF+ hops across).

Years ago, I was able to sit here in SW Idaho and connect to nodes in
WA, OR, CA, ID, MT, UT, NV, AZ, WY, BC, AB, and sometimes farther.
Most of these were "direct" (L3) connects, and response was usually
quite fast. If we'd continued to upgrade, expand, and improve this
network, it'd be far better now. Instead, it's almost all gone.

It worked, Gary, and it was fun.

>> When hams use "wirelines" they are not transmitting.
>> The "what" they are not transmitting is immaterial.

I hate tio add to the flames, but.... A ham is a ham even when he is asleep with his radios turned off. The only problem I see with using wirelines is that in an emergency the wirelines may not be there. If they are not there we have not a practiced, sure communications system. I look at packet sort of like field day--practice for when we really need it. During the last johnstown flood the telephone system went belly up. During the Chase maryland train wreck the cellular systems all had massive overload from news media getting a connection to their home paper/station/whatever and simply leaving the connection in place. If we use totally ham facilities, if the wire lines go down, we still operate. If the power goes away we ahve to figure emergency poser.

Otherwise, I could care less if we have a bunch of boyscouts with signal flage stretching from the limit of the hand-held's range over miles of terrain to the another ht-based packet system. It may not be as reliable and as quick as hf or a microwave backbone, but if it works, who cares.

Basically purists should get a life.

It's not a "silly political edict" ... it's probably the only practical way
to
finally kill that ancient 1200 baud AFSK stuff ... make it completely
useless (as opposed to it's current status as only predominantly useless)

"Legacy apps" have held the x86 PC OS back for years and years
now ... insisting that systems continue to support 1200 baud AFSK is
akin to insisting that all modern PCs must run the original WordStar 3.0
from CP/M days ... or that all spreadsheet programs must be compatible
with VisiCalc and Microsoft Multiplan ...

BINGO ... (just kidding) ... But seriously ... why the penchant for the
old-fashioned dumb-terminal-login/BBS paradigm??? What's wrong with
things that are modern, capable of interoperating with the rest of the
world, and work better?

I think you misread my statement ... I said that it wasn't a lack of
capability
that was keeping me from using Linux and that I've installed, administered,
and
used _nixes before ... my only reason for being limited to the M$ virus
right
now is that I don't have enough machines on my LAN right now and have to
use
the virus on the ones I do have for compatibility with work ...

And I just received my Inferno Developer's Kit today, but the package was
damaged (mashed User's Guide and cracked CD-ROM) so they're overnighting
me a replacement ...

NO, Glen ... *you* just have a technically incorrect definition of
"network"
... I guess it's a lot like there are lots of hams who say "Roger" when
they really mean "OK" or "I agree with you" ... it's common, but still
totally incorrect ... unfortunately, there are a lot of clueless hams who
insist on doing incorrect things just because they're so clueless that
they don't know any better ... apparently you fall into that category ...

No it wouldn't have gotten better, it would have (did) collapsed under it's
own
traffic load ... all those "backbone" stations on the same frequency,
with users on the same frequency too all along the way ...

> It worked, Gary, and it was fun.

It *sort of worked* when there were damned few users ... as the user
community
grew, performance got shittier and shittier, but everyone kept adding more
nodes
and BBSs and choking the thing more and more ... all at 1200 baud AFSK, of
course, 'cause that's what MJFKantronicsPacCom had to sell ...

see my response below:
(of course the comment line could be construed
as "advertizing" and would not be allowed via
ham radio so I would, perhaps, put my packet
radio address in the comment line instead)

-----BEGIN PGP SIGNED MESSAGE-----

PGP Crypto ,what I use, allows for
the digital signing of a clear-text
message. The recipient uses the sender's
- ->public key<- in order to verify
that the signature is valid for the
clear-text message..

Since the signature block works just like
a check-sum or hashed representation of
the clear-text message, there is no
problem with digitally signing a message
and sending the message via packet radio.

If you can send a pkzipped file over
packet, a digital signature is no
different :-)

>services.

I'm sorry if I gave the impression that link quality metrics are developed
by ARP. That was imprecise of me. What happens is that the mobile
station sends something which is similar to an ARP request in that it
is a broadcast addressed to QST. Every switch which hear's it will
attempt to respond. Each response will include a signal quality metric.
The mobile station will also be making a signal quality measurement
on each response. It will use the switch with the highest quality metric
by establishing a link with it. If the link quality, as shown by a count of
resends, falls below a preset threshold, the process starts over.

>With two packets coming in over ARP, to routers up stream that determine
>which servers should get the ip packet meant for your machine to route
>on the air, the link that is the slowest will have the effect of
>securing service to your machine because it will be the last to the
>router. Trying to program the router for these cases would be something
>akind to future prediction, if the are more than two servers.

I don't understand what you're saying here. ARP only spans one link.
It merely associates the station calls for that link with their respective
IP addresses. Routing is done based on IP addresses. Routers advertise
routes to the stations they can service. Routers upstream pick the shorter
route, or the one with the highest cummulative quality metrics, and discard
the others. The only way there can be confusion is if two routers advertise

exactly the same metric to a particular station. The receiving router then does a figurative coin flip and chooses one while discarding the other.

Note this is very sketchy. A full adaptive routing protocol is more complex.

3733. ## SURPLUS/EXCESS INVENTORY

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-26 00:00:00 UTC
From: ap6@ap6.com
Message-ID: <33b2d06b.0@news.genesisnetwork.net>
Source record: 28947

EXCESS/SURPLUS INVENTORY WANTED

AX~CESS COMPUTER IS NOW SEEKING QUANTITIES OF EXCESS,
OBSOLETE, SURPLUS, NEW OR USED, END OF LIFE, OVERSTOCKED,
FRANKLY, ANY COMPUTER RELATED INVENTORIES.

IF YOU HAVE A LIST OR CAN ASSEMBLE ONE,
PLEASE FAX IT OR EMAIL IT TO THE NUMBER AND
EMAIL ADDRESS LISTED BELOW.

WE ARE INTERESTED IN ALL TECHNOLOGY DRIVEN HARDWARE
FROM P.C. TO MAIN FRAMES, HARD DRIVES TO MODEMS,
KEYBOARDS TO MOTHERBOARDS.

AX~CESS COMPUTER IS IN THE BUSINESS OF BUYING AND
SELLING COMPUTER RELATED EQUIPMENT. OUR EXTENSIVE
WORLDWIDE NETWORK OF MANUFACTURERS, DEALERS AND USERS,
ALLOWS US TO RESPOND QUICKLY TO THE NEEDS OF OUR
CLIENTS.

WE ARE INTERESTED IN A WIDE ARRAY OF NEW AND USED PC
AND MAINFRAME EQUIPMENT, AND PERIPHERALS SUCH AS;
(BUT NOT LIMITED TO) HARD DRIVES-MONITORS-TERMINALS-
PRINTERS-BOARDS-MEMORY-P.O.S.-TELECOMMUNICATION-CD ROM-
CABLE OR VIRTUALLY ANY TECHNOLOGY DRIVEN HARDWARE.

PLEASE FEEL FREE TO ADD AX~CESS COMPUTER TO YOUR CURRENT
LIST OF BIDDERS AS WE WOULD VERY MUCH APPRECIATE THE
OPPORTUNITY TO BID ON ANY EXCESS, OBSOLETE, OR SURPLUS
INVENTORY THAT MAY BECOME AVAILABLE.

IF YOU HAVE A CURRENT LIST OF AVAILABLE PRODUCT,
REQUIRE OUR IMMEDIATE ATTENTION OR JUST HAVE A QUESTION,
PLEASE FEEL FREE TO CALL, FAX OR EMAIL ME A LIST AT
YOUR CONVENIENCE. I LOOK FORWARD TO SPEAKING WITH YOU
IN THE NEAR FUTURE.

SINCERELY,

BILL SANDERS

>the Proceedings is what finances the conferences.

Two other reasons:

There are copyright issues that prevent putting the Proceedings on the 'net without going back to each author and obtaining clearances; that wasn't practical to do.

And, there are no existing electronic versions of the older papers, so they would either have to be scanned and proofed, or rekeyed and reillustrated -- not trivial tasks for a volunteer organization.

3735. Need DRSI DPK-9600 schematics

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-27 00:00:00 UTC
From: Carl Black <cblack@capecod.net>
Message-ID: <33B486D7.5F74@capecod.net>
Source record: 28863

I sysop a node on the Cape Cod LAN in Provincetown, MA. A lightning strike damaged some equipment including a Digital Radio Systems, Inc. DPK-9600. The schematics for this TNC have been lost. Tried calling DRSI in Clearwater, FL a couple of days ago and got only an answering machine that said to leave a number and they would call back. So far no call. I guess they meant it when they quit the ham business, they won't even talk to a ham... not yet anyway. So, if there's anyone out there that would be willing to provide photocopies of the schematics, the sysop, (myself) and a few other packet hams on Cape Cod would be very grateful. I've got the manual but can't troubleshoot with just that. Be happy to reimburse for the copying and mailing. Email me if you can help.... Thanks.

3736. G8BPQ Non-verbose Node Broadcasts?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-27 00:00:00 UTC
From: john.ackermann@daytonOH.ncr.com
Message-ID: <john.ackermann.780.000F13B0@daytonOH.ncr.com>
Source record: 28864

Hi --

I'm looking for a way to configure a G8BPQ node so that it broadcasts only itself (and not any of the other nodes it may know about from neighbors) in the nodes list on a given port -- this is equivalent to turning off "verbose" in xNOS or Linux Ax.25.

We have a bunch of stations on a full-duplex repeater that act as end-point nodes only, and one or two switches on the repeater that connect to other parts of the network. The end-points pick up the node broadcasts from the switches and rebroadcast them, even though they don't have a real route. This creates channel congestion, but worse it creates some nasty ping-pong effects if a node broadcast from one of the real switches is missed.

Any ideas?

One rule of infantry combat is to scare the hell out of the enemy (more so than your true capability). General Patton wrote that he always told his troops to fire low, as it creates for ricochet's that make a lot of noise. If he would have served in Vietnam, he would have advised to fire everything you had and scare the hell out of them. He was never one to preach conservation of ammunition; worse case you can use the rifles and ammunition of the fleeing enemy :-)

In the Iraq war I met a U.S. soldier who had a very nice weapon (I'm not able to remember weapons names--aircrew you know), and it was designed to fire only three rounds in automatic. In this case, the object wasn't to scare anybody, it was to kill them and move on. You shot what you could carry. The sequence was also different. The area was divided up into kill boxes. Then rockets and artillery softened up the recipients, then the tanks and Helos went in, then the infantry.

The difference between the Iraq war and Vietnam/WW II was that the mission was to surround and kill the enemy. The mission in Vietnam was to surround a city and protect it, and the mission of WW II was to get across the Rhein. Scare them, kill them, it didn't matter; just as long as they kept out of the way.

I think the 3 bullet solution is best for packet networking. We've tried the machine gun that blows the whole magazine, now it's time to aim and shoot.

Steve :-)

I addition to Gary's excellent comments, let me add the voice of experience. A group of us here in the Bay Area have been on 9K6/TCPIP for the last several years. Our experience has been that any sort of omni antenna doesn't work very well, presumably due to multipath. Our choice has been to use horizontaly polarized beams. On 2m, the beamwidth in azmuth is narrower and the gain is helpful. In one case, the reflective path was more stable than the direct path and the increased directivity allowed us to use it and reject the direct path!

One thing about the MFJ dataradio that I don't like is that even after it has been properly aligned, the receiver is only slightly less deaf than a post!

I had the motivation, the time, and the patience to wade through the namecalling and insults to drag out some information here, yes. I shouldn't have had to go to all that trouble. The people who do most of the work on our local system don't have time or patience to read netnews, but they're both on packet. And what about all those potential recruits and users that are on packet? Those are the very people that you need to reach if you want the system to be upgraded.

>That it's not mentioned in QST or 73 is hardly surprising. The two best

All you have to do is write the articles. 73 pays for articles. I don't know QST's policy. They sure can't publish anything that isn't presented.

>periodicals for finding out about advanced Amateur networking, in my
>opinion, are TAPR's Packet Status Register newsletter (quarterly) and

Nonsense... 'nuff said.

>Abundant information on Higher Speed Packet Radio and RF-based networking
>IS out there, and those willing to do a bit of research on their own will
>find it. It's unrealistic to expect it to come to you.

Like hell. Whenever I open a ham magazine, I'm presented with dozens
of color ads for neat ham gizmos. The editorial sections have reviews
and comments on them. You have heard of "marketing," haven't you?

Unless and until you can present your neat new toys to prospective
users, you have nothing but a few experimenters playing self-indulgent
games. "If You Build It, They Will Come" is a nice movie title, but
it's not the way things are done in the Real World. Far as I can see,
you haven't even "built it" yet, either, except in a few population
centers.

When packet first got started, there were articles in 73,
demonstrations at club meetings by enthusiastic users, and all sorts
of promotion by just about everyone involved. BBS traffic had lots of
bulletins with interesting, usable information, and with folks
exchanging questions and ideas about this exciting new idea. There's
almost none of that any more. Even in the so-called "packet" columns
in the ham mags, there's little but redundant discussion of parameter
settings, and the occasional deadly dull, arcane descriptions of the
wonders of amateur TCP/IP. If you want this high-speed
packet-switched network of yours to thrive and compete successfully
with the Internet, you're going to have to promote it. Heavily. Even
then, there's a better than even chance that it's not going to happen.
Without promotion, there's not a chance it'll keep hams from defecting
to the Internet in droves, or attract those who already have defected.

Don't know about QST (I'm not a member) but be careful with 73 Magazine.
While I have been paid for every article I wrote, the last article I wrote was
paid for one year after they published it.

I wasn't the only one. Hard to get authors after that.

73 was given to Wayne's wife before he went bankrupt. She's the funny name
down on the mastheads fine print. The last time he hid a magazine behind his
wife (ex-wife), she ran off with it (BYTE Magazine) :-)

>Thank you Jon. Exactly my point.
>When hams use "wirelines" they are not transmitting.
>The "what" they are not transmitting is immaterial.

I offer that many hams participate in ham radio in ways that are not all based on actual operating. The ham who spends a year designing a new transmitter, only to put it on the air for 10 minutes, then goes on to the next design project participated in ham radio for a year and 10 minutes, not for 10 minutes. The ham who goes to the Field Day site and puts up all the antennas, but doesn't have time to operate, is taking part. The ham, like me, who spends much of his time talking to other hams is taking part in ham radio, even though I operate only rarely.

Is a phone patch "taking part" in ham radio? After all, there is more than radio on both ends. If I accept local traffic, then deliver it by telephone or postal mail, have I not "broken the chain" of actual on-the-air operating? What if I know the recipient has an email address, and forward my traffic to him or her via email?

Let me ask -- how many times have you used the telephone to talk to other hams, or attended a local club meeting, instead of doing it on the air. Are you offering that an in-person meeting is not "taking part" in ham radio, even when the primary bond and purpose of that meeting is indeed ham radio.

In what ways are these fundamentally different than having internet play some role in the forwarding and handling of the message? Is it okay to follow the accepted practice of having the telephone, or US mail, play a role, but not Internet?

IMHO, there certainly is a distinct reason to have Amateur Radio demonstrate to the world that it is a viable communications medium. There are certainly very good reasons to build and maintain an HF (or other) ham-radio backbone, I believe that these are the driving forces behind the belief that Amateur Radio traffic should be Amateur Radio. I agree with and respect these principles. But I offer, too, that there is a distict reason to demonstrate to the world that Amateur Radio interfaces well to other communications media. IMHO, especially until we have a virtually flawless and seamless HF network, using other means as intermediate steps is not necessarily always a bad thing.

Just a quick thought to someone jumping into this thread in the middle.

That's what I said. It cannot be accomplished via ham radio.
Thus it is not a reasonable near term goal for a HAM RADIO NETWORK.

Got it.
Abandon ham radio, use wirelines.
Force the religion of "true packet switched network" on everyone.
Shoe. Fit. Wear.

Dig dig, sniggle sniggle.

Gotta keep them AX.25 USERS in the dark, eh Steve?

Would it not be MORE efficient to post the information where the
hams who are active builders and users of RADIO networks might see it?

Hmmm ... I think you have little or no understanding of business and
in particular marketing. Think a bit about why Intel and Microsoft
hold the market position they hold. Think about why Apple has failed
to maintain market position. Apply these ideas to ham radio networking.

Once you have spent some time contemplating these issues, you may gain
a deeper understanding of the importance of backward compatibility.

Now think about why the tcp/ip ham radio networks have mostly failed.

Get it?

No? Well, it doesn't matter, since you are only one user.

> old-fashioned dumb-terminal-login/BBS paradigm??? What's wrong with
> things that are modern, capable of interoperating with the rest of the
> world, and work better?

Perhaps you could ASK folks why they like to use simple applications,
and do not like to use complicated ones. I've given that choice for
many years (users are free to use the AX.25 BBS, the JNOS system via
AX.25 or via tcp, or the http services provided by my web server).

I provide all these services over the same radios (1200 baud and 9600
baud) and the users overwhelmingly (more than 97%) choose the simpler
solution (traditional AX.25 services).

What is wrong with those things that are, as you say, 'modern' is quite
simple: "Nobody has bothered to hook them up to the old stuff so they
are useful OVER HAM RADIO." The bulletins cannot be automatically
moved into the nntp server. It is very difficult to get the email to
exchange properly.

(This is what USERS OF MY SYSTEM have told me when asked why they
prefer the AX.25 BBS to the other capabilities provided to them.)

"Why bother to login using telnet, when it is SIMPLER to login using
AX.25 ?"
"Why bother to use TWO protocols (pop, smtp) for email when ONE will
suffice?"

(These are NOT my ideas or viewpoints, but views expressed by users of
my system. Any ninny who claims "Hank says ..." can expect a serious
flame war in response. Again: the above comments are FROM USERS OF MY
SYSTEM.)

Would the users make use of tcp/ip based applications? Yes they
certainly
would, IF those applications existed and provided the level of service
available from the AX.25 applications. Hope someday someone will make
that linkage, and then users may well migrate away from AX.25
"traditional
BBS systems."

SO Carl, if you have a "better" way of doing what the users want, tell
us about it. Describe how to set it up, and how to hook it into the
existing system in such a way as to provide MORE or BETTER service.

Once you do this ... THEN the users will follow.

But first you might want to check out the present AX.25 network
and find out exactly WHAT capabilities exist, and what the users
expect from "their network." You've been gone a long time ...
... and are seriously out of date.

Set Minimum Obsolesence to Broadcast one unit higher than Initial
Obsolesence Count. Ie. in X1JR4, Parm 5=5; Parm 6=6.

Check out the North East Digital Association pages at:
http://www.cam.org/~ama/neda/NEDA.html. This use is equivalent
to a user port.

>the distant machine would provide.

There are two problems with that approach as a general solution. Those
are that every disk on every machine in the network would have to have
every bit of information published on every other disk in the system. In other
words disk capacity could rapidly expand expotenially to a very unreasonable
size. The second problem is that information on different disks in the system
would be more or less out of date depending on the propagation time for updates
through the system. While it may suffice for a small relatively static database
like WP, it isn't a general answer.

For example, an amateur callsign server could be based on a CDROM of
indeterminate age at every site, or it could be based on querying a server
updated from the FCC database every day. I know which one I'd prefer.
Similarly, I'd prefer to be able to access a keplerian element server which
was updated continously from NORAD rather than depending on replicated
bulletins which may be a week or more out of date. That's particularly important
this week with the gyrations MIR is undergoing, or any time a new satellite is
launched. And there are over 50,000 objects in space tracked by NORAD,
but the circulating bulletins only mention a few. If I want info on one of the
less popular ones, the replicated information won't have it. But if I can access
the information directly from the source, I can immediately get what I want.

>Sure, there must be such applications. Can't think of any ...

We use the network to report TOA information from a distributed grid of lightning
sensors. This allows a central computer to triangulate the most intense areas of
storms. The information is only of historical interest if it isn't available in near
realtime.
We also need to interrogate remote wx stations in near realtime for temperature and
wind speed data. Downloaded stills from strategically placed cameras can also give
a near realtime picture of sky conditions if the network is capable of delivering the data
rapidly. None of this would be of much value if it had to propagate by replication, IE
store and forward messaging.

>> Any system in which a single user is interested only in a very small

>There are many flavors of replication ...

Certainly false distributed databases would be of little value.
As Paul notes below, there are serious problems with attempts
to replicate databases, not the least of which is the disk capacity
required. I realize that currently disk capacity is relatively cheap
while network bandwidth is not, but that needn't be true indefinitely.

>> send out their contribution once a week as a traditional bulletin and

>
>
>The next question we might ask is: "What do the users want?"

Most of them don't know. Who wanted web browsing capability before
the web existed? Most users didn't, because they couldn't even conceive
of the idea until they saw it in action. This is true for most new applications.
The user doesn't know he wants it until he sees it in action.

>In my view the marketing questions must be answered before we
>begin any engineering design.

It should be pretty clear that users want the functionality that they find
on the internet and the web. They are voting with their feet for that sort
of access. We have to offer them equivalent functionality, or something
even better, or they have no reason to bother with us.

Note this doesn't necessarily mean that our network development needs
to be totally user driven. That's appropriate for a commercial service trying to
maximize billable minutes, but it may not be appropriate for us. The golden
rule in an amateur network is that he who codes (or links, or provides sites,
etc) rules. We may design systems and networks just because we want to
rather than because they target a certain pre-existing user demand. It is
typically the case, however, that if we build something neat, users will find
it attractive and useful.

Source record: 28870

Hmmmm, after reading the flood of all of these messages as to when we are going to kick start packet several things come to mind.

1.) Why is all of the discussion here on the Internet and not on packet?

2.) Why all of the arguing and no solution finding?

3.) Has any body that is discussing here actually looked at the user figures on a ham radio bbs over the last 2 years and really noticed the severe drop in usage?

4.) Has any body got a solution to making packet radio more interesting, faster and more colorful to compete with the Internet and the WWW?

5.) One thing for certain, I am glad that all of the name calling is here and not on packet radio. This way the new hams don't have to be exposed to the old dusty fart syndrome on packet radio, ie., the infamous discussions much talked about on 20 and 75 meters. I think that it is about time folks quit getting upset with each other and try to integrate a bunch of ideas into one big idea before the basis of the whole discussion dissapears because packet radio no longer provides what the **USER** wants to see. Not what the sysops think is right, or any other personal quirk or dislike. I guess that we seem to have moved away from the original idea of packet and turned it into a little world of "do it my way, or not at all because I am running this little piece of the show."

The answer to question 1 is your question 3. Everyone left packet that's not
a programmer or a tinkerer. Most packet users don't want to be bothered by
non-local issues, or hyperbolic solutions.

> 4.) Has anybody got a solution to making packet radio more interesting,
> faster and more colorful to compete with the Internet and the WWW?

Yes and No. Solutions are a dime a dozen, but there is no support for any
of them. The people who own the RF sites aren't interested in change. Most
just shut down before they are forced to change. A BBS just shuts down, there
is no upgrade, when the users go away.

"If you build it, they will come."

New RF sites by experimenters get little use, because most new packet users
read the magazines, see the 1200 baud Ads, and get stuck with a 1980's tool.
They quickly sell it at the swap meets, never to return to packet. Most new
Hams don't belong to clubs, so they don't get the benefit of word-of-mouth.
So the experimental sites are unknown. One solution is to create a 1200 port
on the experimental site. It's been my experience, that the 1200 users then
use the experimental site as a lazy way of changing channels. They node
hop to another frequency in the same town and go 1200<->9600<->1200 for
example. They never go out and buy/build a 9600 for themselves. They are
stuck with a poor investment, and will run it for years, and years, and years...

You can't blame the manufacturers, they are making money, or they wouldn't
build them. They don't really care if the product is useless.

The port QUALITY parameter sets the default quality for nodes heard on a
port. Also, only nodes with a quality equal to above the MINQUAL set for
a port will be broadcast. So, if you set MINQUAL higher than QUALITY,
the node will only broadcast itself and any other routes you have locked
in with a quality above MINQUAL. If you set QUALITY equal to MINQUAL,
then it will broadcast only itself and its immediate neighbours.

I had several a couple of MFJ's in about 2 yrs ago and I was
distatified with the reliability due to multipathing. I had strong
signals but couldn't get a steady reliable dataflow. Yagi antennas are
out in my neighborhood and they will not work in the attic. I was
thinking abiut trying it again but I want some reccomendations on
which TNC's have been proven reliable. I am looking for a good used
dual 1200/9600 baud model.
Thanks!
Bob

Hmm. Did you read the rest of the message? Filling the link is an orthogonal effect. Although it >will< increase the latency the relationship (perhaps by a large amount) is not a doubling with each hop. (In fact, I still don't see how you get "doubling". I still think it is linear. (If you got this from a paper that I can get to, I would be happy to go read the paper first).

First, we have to assume that the endpoints are using slow start and related congestion control mechanisms (any TCP-based network will not work otherwise) and that the error rate is low enough to to have an effect (this assumtion may be shaky for packet radio paths, but lets leave it for now). A sender will start with a small window that will not result in any queue buildup. It increases its window until a packet drops from overflow at which point it backs off a bit.

Now at that point, the queues along the way tend to be fairly full, but if the sender stays at this lower rate they will drain down. Of course the sender does not stay at this rate, it occasionally trys to bump up the window size (or another connection starts) this DOES have the tendency to keep the queues full and does have undesirable effects on latency, but is still >linear< with number of hops. (Actually, I THINK it will be limited by the size of the shortest queue (measured in time) along the path).

But, that being said, there are several ways you can keep this latency down:

1) Only queue up a very limited number of packets per queue. It is normally not a good idea to build switches with too much queuing per port. There is a tradeoff between link utilization and latency. Also, doing this with just tail drop (see 3) can result in various capture effect which results in one TCP connection getting more than its share of the BW.

2) Do something other than FIFO queueing for interactive flows which care about latency. There are various number of ways to decide which flows get priroity service (e.g., ones with small average payload sized are probably telnet). A few of the commercial routers support this.

3) (Best of all) Do what is called Random Early Discard (RED). In this approach once the queues start to get up to a certain size, you randomly discard packets (either already in the queue or

before they are added). This interacts in some rather nice ways with the standard TCP congestion mechanisms to keep queue sizes down, but still result in fair behavior. Most routers and switches are starting to employ this strategy. I can point you to some recent papers by Van Jacobson and Sally Floyd in this area (We have a few collaborative research projects with then, and I happen to have them handy).

If we do somethink like RED in packet radio switches (which I strongly recommend) then we can greatly mimimize the effect of latency, and build deeper networks.

Well, my actual concern was about use of any sort of encrypted data in amateur radio. I am well aware of the issues vis-a-vis export. My interpretation says that DES for the purpose of hiding the signal content would NOT be allowed under Part 97.

Now authentication is different, and it is my hope that it is allowed under the spirt of the regulations (even though a strict reading could still lead to the contention that it is prohibited).

Well, any use of encryption is nothing like a pkzipped file. Most uses of encrypion in authentication involve encrypting a challange (or as in digital signatures, a message digest). A pkzipped file (Assuming it is not encrypted) can be unpacked by anyone. The challange or message digest cannot (that is the whole point). But since no meaningful message content is being encrypted I was hoping that it was still ok (and Gary seems to have confirmed that it is).

This is already being done on a local basis. I can't quite see the need for a remote base far enough away that a WAN is needed to control it. Besides, that's not likely to be a "network" function, anyway. Any individual could implement this using the Internet without any involvement of the "ham packet net" we're discussing.

>Any system, in which the data is less valuable the older it is. The
>traditional example is the DX-cluster, in which a few minutes old data
>is still usable, but an hour old spot is practically useless. In other
>applications we may be talking about seconds and not minutes.

Why not just DX the old fashioned way, which is fun and offers a real challenge? The irony of using a world-wide "spotting net" to cheat one's way onto the Honor Roll is too, too delicious for words. If one wants to utilize technology to work DX, why use half measures? Just use available techniques to automate the whole thing. Wayne Greene suggested this years ago.

>Any system in which a single user is interested only in a very small

>capacity.

Forward just the headers, then, and users can request sends (from the regional base) of bulletins that interest them. There's a small time penalty, but a huge advantage in not forwarding large amounts of data to every BBS everywhere. Doing this offline and automating it might even get your information to you _faster_ than the present system, even with no improvements at all in bandwidth.

Fine, but if we have high-speed LANs and WAN's, then the forwarded date to the regional servers could still be done using radio on existing HF and regional VHF/UHF links. I don't really see the need to involve the Internet for much of what you suggest in this scenario. In fact, it looks like a good approach to allowing us do it ALL on ham radio.

>These are only a few examples and I have selected these examples
>mainly because the problems associated with them are familiar to most

Thanks for the well done answers. It seems to me that most of what you suggest could still be done without involving wirelines, however. The minor delays could be tolerated as a tradeoff in preventing the eventual loss of even the LAN/WAB systems to the Internet for reasons that have already been discussed.

I won't speak for Hank, but from my perspective, most of the nodes and
links that used to exist in the PNW no longer exist for us to access
here in SW Idaho. To the extent that even ONE vital link disappeared
because of the Internet, then that switch to wireline had a
devastating effect on those of us who have no local link to the
surrounding areas. If we have to connect our LAN to the 'net to
establish comms with the rest of the ham world, why should we take the
time and effort to do it when we can just use the Internet for ALL our
comms? I used to be able to connect to Hank's BBS quite easily by ham
radio. If Hank were to put his system on the 'net, why should I worry
about re-establishing several VHF/UHF links to get to him when I can
do it faster and cheaper from my ISP?

The only reason I mentioned encryption, was to separate the Ham links
from the internet. That is, one can not leak onto the other. The object of
tunneling is to connect Ham stations via the Internet, not connect Ham radio
to the Internet.

The current Ham links use Encap, but this will not last long. I'm finding more
and more routers are blocking it out. Therefore, some new method of linking
nodes will be necessary.

> Now authentication is different, and it is my hope that it is allowed

It's perfectly legal. It is merely a signature.

I assume that when you say that 8 hops drops the latency speed of a 56
kbit/s to less than 300 bps/s you actually mean that the latency time
is 256 times that of a single hop connection.

If the connection is running properly and is capable of delivering the
total multiplex of traffic at the speed offered in batch transfer mode
and if we assume for a moment that your calculation of exponential
latency time growth is correct, this leads to an interesting
situation. If the latency times is 256 times the message transfer
time, it would appear that 256 messages would be propagating within
the network at any given time. However, each intermediate step
typically has a capacity of only one message, thus the total storage
capacity of the whole chain is only 8 messages, which seems to be in a
sharp contradiction that the network would be simultaneously
transporting 256 messages.

The only thing that would explain this discrepancies is that the
messages are not entering the network at the speed they are offered,
but that they are stored at the signal source until they can be
delivered. However, this is an indication of congestion and neither
will the batch data flow at the rate offered to the network. So it is
quite natural that also the latency will increase.

I have seen strange things happen on severely congested networks and
on some multitasking operating systems under heavy load, so you might

get an exponential growth in latency in certain cases with certain protocols and network topologies.

However, you are using 100 % congestion all the time, but unless you have huge, never ending batch transfers at the same priority as all other traffic, the link loading will be less than 100 % at times and the average latency will be much less than 256 times. Simply running the large batch transfers at lower priority than interactive traffic will keep the latency in control.

3772. Baycom Linux & 16550A working!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-29 00:00:00 UTC
From: slug@pc2.local.aeminium.pt
Message-ID: <5p1luf$9p@pc2.local.aeminium.pt>
Source record: 28813
Cross-posted to: aeminium.mail.linux.hams,rec.radio.amateur.digital.misc

hello guys.
Today i made an upgrade of my 386DX40MHz to a 486DX100MHz, with onboard controler, serial, pararel, etc.
The 386DX had 16450 uarts and the 486DX has 16550A .
With the previous experience of trying to make the baycom ser12 driver for linux working on a computer of a friend (P166 with 16550A onboard too) the software didn't work has i expected on the 486 either.
So, i've compiled the serial support has a module and changed a bit my rc's scripts ... The steps that i'm using for this thing to work are has follows (i didn't test if the baycom hardware is working cause now its a bit late to go to the garage and switch the radio power on, but at least when i make cat /proc/interrupts is running and not with only the inicialization ticks - i'm working at my bedroom connected to the other PC by ethernet... - but tomorrow i'm going to test it if i get a serial cable for it , cause the controller is onboard, and i'll tell you if its really working . I'll tell also to my P166 friend to test this out just to see if he can too get it working.) :

- run the my own rc.ax25 script with special attention to the lines containing /bin/setserial and ^skip_test
- insert the serial module (/sbin/insmod serial)
- run the /etc/rc.d/rc.serial script

My rc.ax25 is like this (cutted the portuguese comments :) now:

```
------------------------------------------------------------
#!/bin/sh

/bin/setserial /dev/cua1 -a -v uart 16550A port 0x2F8 irq 3 ^skip_test
/bin/setserial /dev/cua1 uart none

echo "Instalacao dos modulos em memoria (ax25,hdlcdrv,baycom):"
/sbin/insmod ax25 >/dev/null 2>&1
/sbin/insmod hdlcdrv >/dev/null 2>&1
/sbin/insmod baycom mode="ser12*" iobase=0x2f8 irq=3
echo "Configurando device (bc0) com sethdlc:"
/usr/sbin/sethdlc -p -i bc0 -a txd 200 slot 100 ppersist 128 half

echo "ifconfig (TCP/IP) :"
/sbin/ifconfig bc0 aeminium.ax25.pt netmask 255.255.255.0 broadcast 10.0.2.255 mtu 512 up
echo "axparms :"
/usr/sbin/axparms -setcall bc0 CT6XXX
echo "route (TCP/IP):"
/sbin/route add -net rede_ax25 netmask 255.255.255.0 dev bc0
```

```
echo "AX25 Daemon:"
/usr/sbin/ax25d
echo "Logging & Broadcasting:"
/usr/sbin/beacon -s radio "Ligacao por radio activa"
/usr/sbin/mheardd
touch /var/run/server.ax25-beacon
---------------------------------------------------------------
```

The first 2 setserial lines don't do nothing at the first time (i think,
since the serial support is not loaled), but when you shutdown your ax.25
support (like running ifconfig bc0 down , rmmod modules, etc) and run after
the rc.ax25 WITHOUT these lines it doesn't work! cat /proc/interrupts shows
no change at the baycom serial interrupt!

My rc.serial that i use configures the serial ports manually, but i think
you can use what you like...but here it is the relevant parts:

```
---------------------------------------------------------------
#!/bin/sh
#
# /etc/rc.serial
# Initializes the serial ports on your system
# MANUAL CONFIGURATION

${SETSERIAL} /dev/cua0 uart 16550A port 0x3F8 irq 4
${SETSERIAL} /dev/cua1 uart 16550A port 0x2F8 irq 3
# for the internal modem:
${SETSERIAL} /dev/cua3 -av spd_hi uart 16550A port 0x2E8 irq 5
echo -e "RTS/CTS Flow Control on cua3\c"
${STTYBIN} crtscts < /dev/cua3
---------------------------------------------------------------
```

bye for now.when i test it more i will tell you

That would appear to be a non-sequitor. The source of the boxes we
use to build the network doesn't have anything to do with the subject
of network building. We need a certain functionality from our boxes.
If we can buy that off the shelf, fine, otherwise we build or modify boxes
to give us what we must have to build the network we want. The network
is the objective, the source of the boxes is just an implementation detail.

No, I just understand what the word *packet* means. We never had
a global *packet* network. You're simply wrong to claim otherwise
as you did above. We did have BBS message forwarding systems,
but that's a very different thing. It really has very little to do with packet
radio other than that it happened to use packet radio for some of its
forwarding links and local access points. Today a BBS forwarding
system is a limited and limiting paradigm for tying together amateur
radio packet networks.

>>applications which happen to forward mail and bulletins over radio

Your memory wears rose colored glasses. We once had a packet switched
network spanning the entire East Coast from Maine to Florida too. When
loading was *very very* light, a packet would sometimes make it the entire
length of the packet network (though latency was huge). But all it took was
for one of the hundreds of links to have a bit of activity and that failed. As
packet activity grew, the packet network suffered congestive collapse. It got

so bad at times that one node of the packet network would hold off for minutes
at a time before repeating a packet, which was of course promptly clobbered.
We have logs of that activity that we played at club meetings.

A number of schemes were proposed to salvage the packet network. One of
the first was to impose quiet hours on BBS forwarding. That didn't work. Users
would just digi-Dx to another BBS. Another was to try to get users to quit playing
digi-Dxer. That didn't work either. Other things tried were to speed up the links,
but the network was only as strong as its weakest link, and we never could get
every link, or even most of them, upgraded. Besides, we quickly learned the old
lesson that activity will expand to fill the resource available. We tried to go to a
LAN and Trunk system to get most user activity off the vulnerable trunks. That
didn't work either. The users wouldn't stay on their LAN frequencies, and many
areas were resistant to the idea of needing switches anyway. Finally, the network
simply fell apart because no one wanted to bother with it any longer because it
offered so little for so much effort. And that was a completely rational and reasonable
response.

Here in Georgia, we turned our efforts to improving our more local networks
where we could make the needed changes to get the performance and reliability
up to a reasonable level. We've succeeded handsomely in that effort. Then we
turned to internetting those networks on a modest regional scale, a few hops.
We've succeeded to a fair degree with that too, but it became clear that we could
only push that so far. Latency started to become a problem again. And the
sparse nature of amateur distribution meant we started placing unreasonable
demands on our network maintainers.

So we've started doing the long distance internetting links by wormholes. That
lowers latency enough, and offers sufficient bandwidth, that we can now reasonably
do a national or global internet to tie together our local amateur packet radio networks.
Hank and a few others don't seem to like that because it fails their religious purity
tests,
but that's their problem. We don't feel compelled to worship at the same altar as they
do.

Aside from some BBS sysops, most of us *are* AX25 users at the
link level on radio (thanks mostly to TAPR). But so what? That doesn't
have anything much to do with distributing information to the amateur
digital community. QST uses the Post Office to get its word out. Does
that mean that amateurs are in the dark because they don't send it by
one of your BBS systems or tap it out in Morse?

>Would it not be MORE efficient to post the information where the
>hams who are active builders and users of RADIO networks might see it?

You bet, which is why it is posted where it is. People who depend solely
on messages circulating on W0RLI BBS's for their technical information
are so far out of touch that they largely aren't doing anything relevant
anyway. People who are actively doing things with packet networking
know that they have to draw on a number of information sources. Targeted
print and electronic media, IE the web, mailing lists, and newsgroups, are
some of the better sources they can use. Radio BBS systems, OTOH, are
one of the least efficient and useful of those sources. Most of the builders
and doers I know haven't checked into one of those things in years.

BBS? How quaint.

Nope, I didn't misread your statement. You said hams were too dumb to
install an OS that didn't self-install like Win95. Regardless of whether that's
true or not, what I said was that Red Hat *does* self-install that easily (in some
ways easier). I also noted that the emulators in Linux have gotten quite good,
so it is possible to run most common Windows apps under Linux. That can
admittedly sometimes be a little complicated to get working properly, but
then it is often difficult to get some Windows apps to work properly under
Windows too. Windows often lets things interact in unexpected ways so
that you may need different load configurations to run different programs.
Having to reboot when you move from one application program to another
is unacceptable behavior from a real OS.

>And I just received my Inferno Developer's Kit today, but the package was
>damaged (mashed User's Guide and cracked CD-ROM) so they're overnighting
>me a replacement ...

You'll like it. Running hosted on top of Windows doesn't give you the stability of
a real OS, but at least you can explore the features of Inferno without dedicating
a machine to it. It's better, if you're going to run Inferno in hosted mode, to run it
on top of a real OS like Linux, of course.

>2.) Why all of the arguing and no solution finding?

Mainly because there's no agreement on what packet networking *is*.
If people can't even agree on what it is that they're doing, and have
little or no idea where they want to go with it, there's little chance of
finding an agreement to a solution to such a nebulous problem.

>4.) Has any body got a solution to making packet radio more interesting,
>faster and more colorful to compete with the Internet and the WWW?

Well, we could certainly provide some more interesting services. We could
certainly speed up the local loop in most areas. And we could internet our
LANs into a real global packet network via wormhole links. But I don't know
that we can or should try to position ourselves as competitors for users with
the internet or the web. That's a competition we'd lose.

We should be aiming to position ourselves as a resource for those who want
to learn about the internals of packet networking, from hardware to protocols,
and about how to internet those networks, and about how to tune and streamline
those networks for optimum performance. We should position ourselves to
attract people who want to experiment with the technology, and what they can
do with it. In short, we want to position ourselves to offer the opportunity to do
things you can't do as a customer of an ISP providing access to the internet
or the web, because they are commercial/government entities who don't want
people tinkering with the innards of their systems . We want hackers (in the
good original sense) while the ISPs want customers.

What? Now you're saying that there is no link. I thought you said there
was a wireline replacing one or more of the links. If so, why should that
cut you off? Is it just because you won't use the path now, for religious
reasons, because it is no longer "pure"? I knew that was Hank's hangup,
but until now I didn't know for sure it was yours too.

>If we have to connect our LAN to the 'net to
>establish comms with the rest of the ham world, why should we take the
>time and effort to do it when we can just use the Internet for ALL our

>about re-establishing several VHF/UHF links to get to him when I can
>do it faster and cheaper from my ISP?

Well if your only interest is saving time and effort, and reading mush on
Hank's BBS, definitely go with the ISP, and get Hank to do it too. Pay your
$19.95 and dial the phone. It doesn't get any easier than that. Of course
you won't be able to experiment with packet protocols or hardware if you
do that. The ISP will have his own definite ideas about what protocols
he'll want you to use, and he won't look kindly on you tinkering with his
routers. You'll also be stuck with whatever speeds he supports, and you
won't be able to operate mobile. But that's Ok, you just want to use a
BBS. You don't care about any of that anyway.

But if you build your own LAN, you can tinker with it to your heart's content,
and you can internet it with other amateur radio packet LANs via a wormhole
so you can have realtime packet connections to distant places. Since the
wormhole encapsulates your packets, your ISP won't care what you're doing
inside that encapsulation. You can try various protocols, you can try various
routing schemes, you can tinker with the RF hardware in the local loops, setup
a broadcast server, do realtime multicasts, try your hand at writing some new
distributed applications. Etc.

It's *your* network, even if some parts of it may ride over a wire while other parts of it use radio. Beyond the local loop, you can't tell if it is radio or wireline anyway, except maybe that the wireline has less latency to distant places. So why should you *care* what's happening several hops away? Unless, of course, you have some religious hangup about "purity" that won't let you use "unclean" services.

Ah, but you're just a *user*, so you don't care about any of that. So pay the $19.95, fire up Netscape, get on the newsgroups, and bitch and moan. That's what you wanted to do on packet anyway, and you have a larger audience on usenet. My patience is wearing thin with this repetitious "why don't I just get an account with an ISP?" business. If that's what you want to do, then *do it*. No one will care, least of all those who are doing things with packet, including internetting their LANs with others far away. And while you're at it, dump your other amateur equipment too. Get a cellphone. You didn't want to know about how it works anyway, you just want to yack. Pah, users. If I get another clueless support call tonight, somebody's going to get a cussing.

Hi Bob:

The TNC isn't going to solve your problem, if the root difficulty is
multipath distortion. Have you actually tried using attic-mounted beams
yet? You may be lucky and find that they work reasonably well. As
for specific TNC's, I've had good luck with the Kantronics 9612. It's
one of the easier TNC's to set up for 9600bps.

I too, fondly remember those days, Glen. That was when few amateurs
in the areas you speak of, knew much about what amateur packet radio
was. I believe what you are refering to here are "links" rather
than a network.

But do you remember when all that changed? I certainly do. It all
changed dramatically when the BBS application software appeared
on the scene.

No, this wasn't bad. It shows how dramatically amateur packet radio
has evolved. It's still a viable means of digital communications.
Some now, wish to take it to an even higher level yet.

If you wish to explore the endless possibilities with the rest of
us, get and install and understand what is "possible" in amateur
packet radio. Get Linux!!! I did and it sure opened my eyes.

Actually, you can add a 9600 bps modem to the PK-232MBX. The TAPR modem
kit has directions and TAPR also sells a couple of interconnecting kits to
make the job easier on the PK-232MBX. See http://www.tapr.org for more
information.

3791. 2 Meter Packet BBS in Manhattan?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-29 00:00:00 UTC
From: Dick Williams <dickwms@erols.com>
Message-ID: <33B6E88E.699B@erols.com>
Source record: 28903

Can any one tell me the freq and call for a packet BBS on 2 meters in Manhattan Island? My brother lives on the upper east side and would like to connect to a BBS from his apartment.

Thanks for any help, Dick

>That's what I said. It cannot be accomplished via ham radio.
>Thus it is not a reasonable near term goal for a HAM RADIO NETWORK.

It can be accomplished by amateur radio, just not by 100% *pure* amateur
radio. Your insistence on that sort of purity is a personal problem you have.
It is not an inherent requirement. We used to run a BBS which was co-located
with one of our 56 kb switches. It connected to the switch by a direct wireline.
In your view, that would make the network not a HAM RADIO NETWORK at all.
Well phooey to that.

It would have been *insane* to use a pair of radios to span the 6 feet between the
BBS and the switch. It would have hurt system performance by adding loading to the
RF LAN, and it would have served no useful purpose. But you insist that it must
use a radio link or we don't have a HAM RADIO NETWORK. That says something
about your mental state, but very little about the engineering of amateur radio
networks.

We don't run that BBS anymore, obsolete paradigm, but we do make use of
a wireline connection to tie us to wormhole services. That still makes our
network a HAM RADIO NETWORK. Nothing has changed except the better
way we provide WAN services to the network, now on a packet switched,
rather than message switched, basis.

>akin to insisting that all modern PCs must run the original WordStar 3.0
>from CP/M days ... or that all spreadsheet programs must be compatible
>with VisiCalc and Microsoft Multiplan ...

In fact, Linux runs Wordstar 3.0 just fine in its CP/M emulator. Runs it
faster than on old Z80 systems too, even runs it faster than some of the
bloated word processors for DOS and Windows. I still use it when I want
to process a lot of text in a hurry in ways that would be clumsy using grep,
sed, or a Pearl script. If the infrastructure is competent, it can deal with
legacy applications without penalizing those using more modern applications.
There is only a problem when you try to bottleneck the newer applications
through a less capable system.

1200 baud is fine for when you have little data to send, and want to use an
unmodified FM voice radio to do it. As long as that's separated onto its own
LAN, away from higher performance systems with which it might interfere,
there's no reason not to choose to use it. Any halfway capable LAN switch
can integrate it into the higher performance network when necessary without
any problem. APRS is an example of an application which is nicely served
by 1200 baud at the user level.

Everything isn't a nail, so your toolbox shouldn't just include a hammer.
Selecting the right tool for each job is the mark of a competent worker.

NOS is happy with ls or dir, both are valid. Make sure that
you have the dos/unix flag set properly so that it is aware of
the difference in the EOL conventions of the two systems.

But why run a DOS NOS on Linux anyway? The native
Linux kernel services are better.

Interesting.. But wouldn't you need a certificaton authority to bind
the signature public key to the call sign?

I will make the wild suggestion that a non-profit ham radio organization
perform this function. I think it would be a good way to promote this
technology. USENIX does something similar for its members. How about
an ARRL or TAPR signed key?

There used to be an advertisre in PC or Byte magazines that sold aftermarket cases with full metal chassis and the only plastic was the faceplates. I received som literature from them once but a quick look through the lit box didn't turn anything up. I think it was US power systems or something like that. Texas Micro as I recall also sold a "tight" case as well. You might try a search on one of the search engines.

Any of the industrial computer firms could likely point you in the right directions as well.

Sorry I can't be of more help.

I don't recall the NPRM number, but authentication is codified in 97.219.

Define "very hard." If you want to attract more experimenters, you
gotta get the word to them. I think the new buzzword for this is
"push technology." How can I go looking for something if I don't even
know what to look for? You didn't even bother to include a URL in
that one reference you gave me.

Why? If it isn't even available on ONE computer, adding more
computers isn't going to make any difference.

>You seem to think we're in competition with America Online, but we
>are not. Not only is that illegal, it isn't what amateur radio is about.

We are in competition with AOL and hundreds of other things for the
attention and money of young people, and to some extent, older ones
too. I really don't understand why you can't see this.

>The sort of people we want to attract to packet networking are those who
>really want to do packet networking because it is interesting and challenging

Yep. But you've got to find them first, and demonstrate what fun they
can have being a packet pioneer. Nobody's doing that. When packet
first started, there was lots of that sort of thing.

>to them. We need people who want to learn and contribute. If all they want is
>to order a pizza, let them use a cellphone, or their CB, or join a 2m autopatch

...or remote control a camera via packet, or run a DX cluster, or send
ATV over packet, or integrate a BBS into packet, or do some realtime
chatting on packet, or...

>them pay AOL. Just because what they want to do may be (dubiously) legal
>under amateur rules, doesn't mean we have to encourage or support it in our
>subset of amateur radio.

Well, from what I've been able to gather so far, you elitists have
been pretty successful at keeping out all the undesirables, where
undesirables is defined as anybody who doesn't share your exact
viewpoint. Too bad that attitude is contributing to the slow death of

packet radio, and arguably ham radio itself.

Well, yes, there is. UseNet is generally faster, and generally better
at not losing articles. That's no reason to abandon the present
system, of course. I likely would never have had to come here looking
for answers if they had been posted on the BBS network.

>>2.) Why all of the arguing and no solution finding?
>
>Mainly because there's no agreement on what packet networking *is*.

Because arguing takes no cooperation, coordination, compromise, and
hard work. Finding solutions takes all of those.

>If people can't even agree on what it is that they're doing, and have
>little or no idea where they want to go with it, there's little chance of

So we all go our separate ways, further fragmenting an already
fragmented subset of ham radio, thereby allowing the existing network
to die before any viable alternative is in place.

Emulation usually slows things down quite a bit ... most of the things
that I do (like simulations) are numerically intensive and the machine
never seems fast enough (not even a 200 MHz Pentium Pro <grin>) ...
I would be loath to wait around for an emulation ...

3803. KPC3+ problem with KISS and TCP/IP?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-30 00:00:00 UTC
From: mgilbert@oit.umass.edu
Message-ID: <33b71ef5.0@oit.umass.edu>
Source record: 28817

Posted by N1UCP for his friend N1AW. Reply by email to N1AW please:
aswns@hamp.hampshire.edu. N1AW cannot receive usenet news reliably.

I hope this group is the right place for this question -- I am experiencing what I believe is a hardware (or perhaps firmware) problem with a Kantronics KPC3+.

When I first put the KPC3+ into TCP/IP service using JNOS under Windows 95 I encountered a lot of problems with crashes of the hardware, which I wrote off to a mismatch between Windows 95 and JNOS (1.10k, probably written previous to the release of W95). But my goal is to move from MS-DOS or Windows to using a Linux machine as a router between different nets (including radio), and when I started seeing similar problems with TNOS under Linux and with Linux kernel-based ax.25 I became suspicious of the hardware.

The problem under W95 manifested as a crash, sometimes detected by W95 and sometimes (especially in DOS mode) just the system freezing and becoming totally unresponsive. But under Linux I could see from a second virtual terminal that TNOS wasn't really stalling when a similar thing happened, in fact it was eating CPU time like mad, doing something that made response to the keyboard so slow I had assumed at first it was nonexistent.

This manifests itself after a substantial period of operation, and my hypothesis is that the KPC3+ firmware is not managing a buffer properly, and the buffer is either overwriting other variables or is overwriting itself in a circular buffer, so that the xNOS or Linux kernel ax.25 driver cannot find the end of a packet and gets caught up in reading a never ending stream of data it can't properly handle. I should also mention that the "con" LED on the TNC stays locked on for long periods when this happens, in KISS mode this LED indicates a transfer from the TNC to the host is taking place, and in normal operation it blinks on briefly when a packet has been received. Also, after a crash if I restart the computer without resetting the TNC, on subsequent connection with a terminal program I see a long and repetitive stream of mixed garbage and recognizable segments of text -- as if a buffer were being repeatedly dumped.

I also have available an older KPC3 (not a Plus). I have tried it in each computer+software configuration where I have seen these problems with the KPC3+ without seeing this. I am more than a little annoyed about this, as I am a bit far from home and not in a position to easily arrange a swap of equipment.

I suppose I should have a question in here: there are several, actually. First, is this a known problem with the KPC3+, or have I made a big mistake

in my analysis? Second, is there any way around it? Obviously if it is a problem in the Kantronics ROM there must be an upgrade due. But it seems that part of the problem is in the software that is apparently willing to accept an endless stream of garbage from the TNC without a place to put it or any hope of extracting valid packets.

Any help would be appreciated. I am writing from Nicaragua, unfortunately some options like trading in the TNC are not practical for me. And, yes, I have written to Kantronics. So far no response (but I'm pretty impatient, I'll admit).

Mailloop is an Industrial Bulk Email and Newsgroup Broadcasting Program.

Visit http://205.199.4.219 for More info.

Here is just some of the many hunreds of Mailloops Features:

Send Bulk Email to Thousands of People an hour-

Send Bulk Broadcasts to the Newsgroups with an Anti-Cancel Bot Feature-

Send Binaries to the Newsgroups in Bulk-

Process your incoming Mailbox -

Build E-Mail and Newsgroup Lists From:

Extracting from the Newsgroups-

Extracting from a Whois-

By processing your incoming Mailbox-

By using the finger Client (You can finger a domain and extract all of the email addresses)-

Extracting From a Import File-

Extract from a Web Page-

Extract from an FTP Site-

And Many Many More.

If you interested in these and many other features that Mailloop has to offer, or to obtain a copy,

Visit Our Web Site:

http://205.199.4.219

3805. Lowest INTERNATIONAL Calling RATES Available !!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-30 00:00:00 UTC
From: remove@freemail.nll
Message-ID: <5p7i6i$945$4617@cadmium.aware.nl>
Source record: 28819

We offer very competitive low international calling rates worldwide, with saving up to 85% !!!

Some examples:

Australia - USA = 0.29 US$/minute
Hong Kong - UK = 0.61 US$/minute
New Zealand - Netherlands = 0.66 US$/minute
Japan - Germany = 0.61 US$/minute
Singapore - USA = 0.35 US$/minute
Sweden- Canada = 0.36 US$/minute
Germany- Dom Rep =0.71 US$/minute
France - Bahamas = 0.60 US$/minute

There are no fees, other than usage !!

If you might be interested in more information on our services and rates to other countries, please visit our website at http://www.angelfire.com/biz/GTconsult or send us a message to GTconsult@freemail.nl and tell us the countries you call now, what you are paying now and which service you use at the moment !!

If you think this is not the appropriate newsgroup to place this advert, please let us know by sending an e-mail to remove@freemail.nl and mention the newsgroup in the subject heading, so that in future we will not advertise in this newsgroup again !!

Regards
Robert

3806. TPK 1.82 - how to set up for a new BBS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-30 00:00:00 UTC
From: Kevin Williams <williams@hertz.ee.sun.ac.za>
Message-ID: <33B7772B.41C6@hertz.ee.sun.ac.za>
Source record: 28820

Hi All,

During the past few months my BBS has changed callsign. I have changed
all references to the previous callsign in the BPQCFG.TXT and CONFIG.TPK
files, and run the BPQCFG program. All seems well, but TPK won't start
updating message headers from the new BBS. I have tried copying the old
".LST" and ".NUM" files, and creating a new subdirectory for the new
BBS, but nothing helps.

My route to the BBS is direct.

Is there something simple I am missing?

Many thanks,

Kevin

>technology. USENIX does something similar for its members. How about
>an ARRL or TAPR signed key?

That is a great idea and from a technical standpoint could fairly easily be implemented by just getting one of the web-based public key servers (like the one at MIT) and putting it up on the TAPR or ARRL web site.

The harder problem is that of establishing the "circle of trust" (that the public key for KC7YJA in the key server really does belong to him and was not put there by someone else) one could easily imagine doing something equivalent to the IETF key-signing parties at hamventions and club meetings.

Now, this being said, is anyone actually using public key encryption in ham TCP/IP networks for authentication?

Don Hoffman - KC7YJA

ARP may span many "links" if your network tunnels ip over NET/ROM.

> Note this is very sketchy. A full adaptive routing protocol is more complex.

Gary,

If you are unable to tell the difference between using wire
to connect your computer to your radio, and using wire in place
of that radio to make a connection to other radios, all hope is lost.

So send me a message using that network you claim does not exist.
If you didn't lie so much, it might be possible to take you seriously.
tcp/ip is a "bunch of junk"? I don't think the others who take
part in this discussion would agree with you. Perhaps if you paid
attention to what I post you would understand that I RUN tcp/ip,
and am attempting to connect it with the existing AX.25 network.

As I've asked before: What are your suggestions?

>
> Hmmmm, after reading the flood of all of these messages as to when we are
> going to kick start packet several things come to mind.
>
> 1.) Why is all of the discussion here on the Internet and not on packet?

Because many of the hams taking part in this discussion are not ON
packet.
i.e. they are unable or unwilling to post their veiws on the packet
network.
For example, wa6vse, n8gnj, ke4zv appear to have no connections to the
packet radio network. Check for WP entries, they ain't there.

> 2.) Why all of the arguing and no solution finding?

The folks who advocate replacing ham radio networks with wirelines
have won. There is no longer much viable radio network, other than
small local pockets, unconnected to each other other than via commercial
networks ("wirelines" ... "the telephone company").

> 3.) Has any body that is discussing here actually looked at the user
> figures on a ham radio bbs over the last 2 years and really noticed the
> severe drop in usage?

Yes, and we find the same general situation reported by Larry (wb9loz).
In the Portland area, the drop over the past 12 months is on the order
of 20%, much less than what Larry reported, but quite significant.

> 4.) Has any body got a solution to making packet radio more interesting,
> faster and more colorful to compete with the Internet and the WWW?

Have made several suggestions which I think might help. In short, we
need
to make the appropriate linkages between existing tcp/ip and non-tcp/ip
applications and the "more interesting" web based applictions. That is
not happening, and in fact there has been almost no discussion of ways
and means.

> 5.) One thing for certain, I am glad that all of the name calling is here

It is us "old dusty farts" who built the existing network, and will
build
any future network. The "wet behind the ears kids" do not have the
experience,
knowledge, money or free time to get the job done.

Gary,

This group is called "... digital.misc" and not "...
packet.switched.networks"
Certainly packet switched networks are part of the "... digital.misc"
but
so are networks constructed using CLOVER or PACTOR as transport.

Many of us who take part in this discussion are interested in a much
broader range of issues than simply "packet switched networking."

Those of us who write applications generally do not care what kind of
transport we use, as long as it will move the bytes from here to
there.

So you will see discussion of many kinds of networking here, since the folks who read this group have a wide range of interests, all within the charter of "... digital.misc".

So if you want to pretend that "network" means "packet switched network"
you are free to do so, but I think that most of the readers of this group are aware that there are many kinds of networks, some digital and some not. I think the readers of this group also understand that there are many issues of interest to readers of "... digital.misc" that have nothing whatsoever to do with networking. In fact, I suspect,
but cannot confirm with solid data, that most hams who are interested in digital communication have little or no interest in networking.

You will find many of them on HF, enjoying various digital modes in their quest for new countries, better rag-chews, higher contest scores,
and even their participation in the oldest ham radio network: the National
Traffic System.

3814. Chair-Pak !! a backapck with a built in Chair !!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-30 00:00:00 UTC
From: chairpak@chairpak.com
Message-ID: <33b77918.0@news.net999.com>
Source record: 28828

Welcome,

Chair-Pak is a great idea!!!

It's a Backpack AND a built-in Chair!!!

See it at http://www.chairpak.com

3 Sizes Full Pak, Day Pak, and a Child Pak!

How many times have you gone somewhere and needed a chair ?
beach waiting in line with friends
hiking around the campfire conventions
air shows at the park in line at the DMV
outdoor concerts hiking trails car shows
camping on campus reading at the poo l /beach
fishing trekking rest areas
poetry readings jams outdoor games
outdoor sport events story telling to children picnics
theme parks national parks hunting
backyard outdoor weddings and anywhere you want to SIT!!!

Carry your stuff and your chair where ever you go!!!

Where do you want to sit today?

Chair-Pak is made of the strong durable Dupont Cordura and the frame is of strong and light T6 aluminum.

If you would like to order, or get more information about Chair-Pak, please visit our web site

http://www.chairpak.com

Maybe Hank was in the know at one time, but not anymore. I offered to funnel all ham email traffic through the BBS system in exchange that he would promote at least a speed increase through the mail transport links, drop any hint of exclusion, and remove human intervention from his chain of BBSs and I would even pitch in a reasonable amount of money for upgrades from my users. Well its been a week, so I guess Hank found that this was unacceptable also. I guess even speed increases and continuance of the HAM BBS system in a improved form are not even acceptable alternatives to the current system. Its a shame, too, as the BBS-SFS, even though not a packet network, is pretty neat in the areas where internet access is not an alternative at all, but they are going to die soon if someone doesn't do something quick. Its funny, I became a ham to get into packet radio, and now that I am financially able to do it, the founders are not interested in its existence anymore.

Well, to you Gary, keep up the good work. Here in Raleigh, we will have a high speed TCPIP LAN soon, using wirelines as the access point and a commercial provider, after that, it will be all air . . . Perhaps we can link up when my end of the chain is working. To Hank and Charles, you are killing this aspect of the hobby by not at least improving your SFS. The SFS will probably be viable to less accessible areas for a long time, if you would only improve it, but since that is obviously not going to happen, I will say, "So long packet BBS-SFS! It could have been

good . . ."

Try INWIN, they make FCC certified cases. They have a home page.

applications.

I see the problem as being that you can't get a critical mass of people to finally bury the corpse and move on to something better as long as the old fogies insist that "the old way is good enough (or, shudder, "better") ...

I posted a proposal here to you, and you haven't written a word about it. At least you could flame me at the bare minimum, otherwise I feel that you aren't even looking to any possible solutions except your own. I guess that would be typical of the mindset you have demonstrated to have here on this newsgroup.

Well, SOME of us knew something about it. Others of us seemed to have
our heads in the sand, it seems.

>was. I believe what you are refering to here are "links" rather
>than a network.

I believe I am referring to a "network." Fire season is upon us,
Mike. It's getting pretty dangerous for you to erect strawmen for me
to set afire.

>But do you remember when all that changed? I certainly do. It all
>changed dramatically when the BBS application software appeared
>on the scene.

Bullshit. The first months I got on packet, probably before you even
got started, I was getting my BBS fix from a system in Helena, about
500 miles away as the data flew. Worked pretty well, too.

The dramatic deterioration came about when Lockout Lids such as
yourself got hold of the node firmware that allowed locking out of
specific ham calls, and Lockout Lids such as yourself started running
BBSs with no clue as to what you were doing and no desire to find out.

>No, this wasn't bad. It shows how dramatically amateur packet radio
>has evolved. It's still a viable means of digital communications.
>Some now, wish to take it to an even higher level yet.

It hasn't "evolved" all that much, even on the _practical, affordable,
available_ hardware level. It's evolved not at all on the level that
really matters, the _human_ level.

>If you wish to explore the endless possibilities with the rest of
>us, get and install and understand what is "possible" in amateur

>packet radio. Get Linux!!! I did and it sure opened my eyes.

Yeah, right. Given your record, I doubt anything could open your eyes, Mike. I have better things to do with my time than tying up my computer and my time learning some arcane OS. If you want to do that, it's fine with me. Just don't try to tell me how wonderful it is. OS wars are for idiots.

>reasons, because it is no longer "pure"? I knew that was Hank's hangup,
>but until now I didn't know for sure it was yours too.

There is no wireline link to Hank or anywhere else in the way you're
thinking. We do exchange zipped packets of BBS traffic with Marty,
but he's in the Midwest, in the opposite direction from Hank and the
PNW. Hank does not send traffic to Marty, as far as I know, so
anything we get from the PNW is forwarded by some other station. This
process gets us a link to the outside world, but it's even SLOWER than
the old RF links used to be. Not exactly what you had in mind, is it?
I didn't think so.

>>If we have to connect our LAN to the 'net to

>
>Well if your only interest is saving time and effort, and reading mush on
>Hank's BBS, definitely go with the ISP, and get Hank to do it too. Pay your

I'd far prefer to read "mush" on a ham BBS that to dig for that same
mush in the sewer that is UseNet. So would many others, it seems.

>$19.95 and dial the phone. It doesn't get any easier than that. Of course
>you won't be able to experiment with packet protocols or hardware if you

Of course I can, if I wish to. We can still play locally, if there's
any incentive.

So far, I haven't seen anybody suggest that a bunch of hams that want
to link LANs and MANs might well be able to lease bandwidth on a fiber
line or a satellite as easily and cheaply as using the Internet. Some
Canadians even had a 9600 baud satellite link DONATED between Calgary
and Montreal, and that was years ago. I've been told that Sprint has
fiber lines available that can be gotten very reasonably by non-profit
groups. If you're going to use "wireline," why not bypass the
Internet congestion and do it right?

>But if you build your own LAN, you can tinker with it to your heart's content,

Been there, done that. I've been doing similar stuff for most of the
21 years I've been a ham. I'm physically, financially, mentally, and
emotionally about burned out. I'd just like to play for a while. I
can still contribute by finding information and passing it along to
others, and by instigating some discussion on how we should be
proceeding.

>Ah, but you're just a *user*, so you don't care about any of that. So pay the

Nice attitude for a ham. Maybe your group should appoint a PR man
with some better public relations skills. Then you can get back to
what you do best, and won't be antagonizing 80 percent of the ham
world.

That's because your little world is even more restricted than the
world you accuse Hank of being in. Most of the folks who are
"building and doing" on packet in this area are regular users of the
BBS. They simply don't have the time to go wading through the
bullshit and bother on the Internet looking for needles in haystacks.

>BBS? How quaint.

The only thing quaint here is your attitude towards things that don't
meet with your approval.

No, I'm not. You just don't accept a common definition of "network."
Both of us know what I mean, so you're just erecting strawmen instead
of addressing the topic.

>We did have BBS message forwarding systems,
>but that's a very different thing.

Only in the method used. Data moved from point A to point Z via
points B, C, and/or D, etc. Same thing happens in QWK BBSs, and on
the Internet, and in your paradigm. To the end user, most of this
matters not one bit, other than the time, effort, and money involved.

I have a 1966 car. It gets me where I want to go, and it costs far
less to maintain and license it than to buy a new one. It goes the
speed limit just as well as a new Mercedes.

If your wonderful new toys are unknown and unused, it's probably
because they have no utility, they're tightly run by control freaks,
and/or they're not being properly marketed.

>You can't blame the manufacturers, they are making money, or they wouldn't
>build them. They don't really care if the product is useless.

If the product were useless, it probably wouldn't continue to sell.

Can someone explain what they mean when a radio say's 9600 BPS Packet ready.

Thanks,

Anthony

Please point to the radio that we gave up. The BBS was never connected to a radio (6 foot RS-232 cable remember?). The switch still has its radios, and so do the LAN members. In fact the radio count in our network has gone up because we gained LAN members when we improved network services.

True enough. Now what does that have to do with calling Glen on his
claim that there was once a "global packet network". He said it. It
is quoted right up there at the top of the message. It's wrong.

> Many of us who take part in this discussion are interested in a much
> broader range of issues than simply "packet switched networking."

Indeed. I'm a Clover user myself. Now what does that have to do with
calling Glen on his claim that there was once a "global packet network"?

> Those of us who write applications generally do not care what kind of
> transport we use, as long as it will move the bytes from here to
>there.

That's true too. The application doesn't care, and neither does the user,
about transports used remote from his immediate local environment.
Now what does that have to do with calling Glen on his claim that there
was once a "global packet network"?

> So you will see discussion of many kinds of networking here, since the
> folks who read this group have a wide range of interests, all within
> the charter of "... digital.misc".

Yes that's true. Now what does that have to do with calling Glen
on his claim that there was once a "global packet network"?

> So if you want to pretend that "network" means "packet switched
>network"
> you are free to do so, but I think that most of the readers of this

>suspect,
> but cannot confirm with solid data, that most hams who are interested
> in digital communication have little or no interest in networking.

I have never pretended that "network" exclusively means "packet switched
network". And I am not going to let Glen claim that a BBS message forwarding
network was a global packet network. He's wrong. You know he's wrong. And no
amount of dancing about the purpose of the newsgroup can obsfucate that.

3832. TNC recommendations

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-01 00:00:00 UTC
From: Marco S Hyman <marc@dumbcat.codewright.com>
Message-ID: <x7u3ie60jr.fsf@dumbcat.codewright.com>
Source record: 28765

Sorry to post on a subject other than the current flamefest on the
future direction of packet radio :-), but some of us (me, anyway)
are interested in getting started in packet and want something that
will work today as well in the future.

Anyway, any recommendations for good TNCs? Buy? Kit? Build from
scratch? Should I look at one TNC for both HF and VHF/UHF or
consider two? Are DSP based units better, or just different?
I am NOT interested in software -- I do NOT use DOS, Win, or Win95.
I run a Sun Sparc and am looking forward to writing my own software
to speak to the TNC. That's where part of my enjoyment comes from.

Thanks for any response.

: which helped me isolate a rx data problem to IC U6. This chip, an
: MX489J (also called an F9246 on the diagram) is bad. It may be a custom
: chip made for DRSI just for use in the 9600 tnc. I have made 3 calls
: to DRSI in Clearwater, FL where I only get an answering machine. A
: voice calling itself Andy DiMartini (D'Martini?) says to leave a name
: and number and they will call back. No call backs yet.

DRSI is out of the Ham business. The chip in question is not a custom
chip. The manufacturer should be trademarked on the chip. Call them.
Andy pretty much WAS DRSI. He probably had to liquidate to get back
some of his capital, so there's no use badgering him to death.

: When DRSI got out of the ham market, I feel
: they still have an obligation to support the products they sold. Our
: packet network group must have 15 or 20 DRSI DPK-2s and about 5
: DPK-9600s. We paid some pretty good bucks for the equipment and now
: they are all awaiting the same fate of the current 9600 problem, to
: become junk because the manufacturer walked away. So much for business
: integrity. If you own any DRSI equipment, pray that it never smokes on
: you. Thanks for any help on the chip.

Why not canabolize one TNC to fix the others. Troubleshoot the thing
using parts from another. You *are* going to have to replace those TNC's,
as they are no longer available. Upgrade one (to a Paccom or whatever)
and use the parts to keep the others working. In 5 years you should
have them all replaced.

If he was going to return your call, I doubt he's going to now.
No sense calling him a criminal and then ask for a handout.
Have you ever heard of a warrantee? Is yours expired?

Using your logic, I should be able to get the Hudson family to fix my
car for me, or honor that sale with spare parts? That, although my
warrantee expired on my 57 Ford, that Ford should honor me with a new
crankshaft and bearings?

Sorry, I don't get it.

I hate to see you when your Sanyo TV breaks...

Yes, it means: "Send Extra Money."

There's only one radio that's packet ready for 9600. It's called a
TEKK. Everything else is crap. Get the Modified KS-1000, it'll do
5 Watts, and that with a beam will get you to the nearest repeater.

What speed are you interested in? I recommend Kantronics for 9600
and below. Look at Paccomm for 19.2 k up to 56 k.

: Anyway, any recommendations for good TNCs? Buy? Kit? Build from
: scratch? Should I look at one TNC for both HF and VHF/UHF or

: to speak to the TNC. That's where part of my enjoyment comes from.

Just need a KISS driver (modified SLIP) for 9600 and below, or what is
known as the Host Mode for driving the TNC with your software. For 19.2 k
and up, you will need a faster TNC (Paccomm Spirit is good), although I
run a DRSI DPK-2 at 10 MHz to run 19.2 k with good success. At 56 k
you have exceeded the speed of a serial port, and you are going to need
a DMA or parallel solution. There's really no building kits in packet
anymore. Stay away from DSP. Very expensive modem, no increase in
capability. If you want to play with DSP, get a Motorola DSP from TAPR.
There's a neat group of Hams that are having a ball with that. You
might be interested in building modems for HF with that, instead of
off the shelf from Kantronics.

Good luck,

Steve

Super morse is hard to use or at least the version I have is. No
readily available does a good job copying code through QRM/QRN. I did
see a demo of a neural net software which seemed to work (for the demo).
done as a Master's project.

The opinions expressed are my own and not related to my employers.

But what of subliminal channels? In addition to a signature, one can also
send some bits of information ... and no one, but the recipient, can
prove otherwise. I recall that the NIST's DSS [Digital Signature Standard]
is supposed to be one of the better schemes for this.

What *packet* radio network would that be, Hank? Are you now trying to
claim the BBS forwarding system is a *packet* radio network? I gave up
BBSing a long time ago, but that has nothing to do with *packet* radio
networks other than that some BBSers use packet radio for some of
their links.

A man after my own heart. While I do use those OSes (required in my job) I am a *NIX junkie at heart.

I have tried a couple of units and find the KAM+ is a very good all around unit for HF/VHF. For experimenting the Data Engine from Kantronics is nice.

The main advantage of a DSP based unit is the easy of mode upgrades/modifications simply by reprogramming the DSP.

It means they have made a connection between the discriminator output and
a connector, also an input to some stage which is modulated.

It DOESN'T mean that the radio will work very well, as in bit error rate,
useable TXD, etc. Most, if not all, of the "9600 ready" radios aren't!

Note, install != configure. Linux still needs some subsystems configuration
to get everything running happily. But you get a working system at install.
This is no different from Windows. You have to configure it too. Linux offers
you lots more services, so if you want to use them, you'll have lots more to
configure. But you can do that as you need those services, just as you would
when you add applications to Windows. Mainly, configuration consists of
getting networking going (uucp and sendmail, if you need them, are the usual
pain, but dial up PPP and ethernet configuration is automated with a pop-up
menu system and will be virtually painless for most people), getting X running
the way you want it (Red Hat comes up running generic X, so you want to configure
it to take advantage of any special hardware acceleration you may have, again
there's a pop-up menu), and getting the various emulators configured (that
takes a bit of work if you're running Windows or DOS apps that need direct
hardware access).

>> I also noted that the emulators in Linux have gotten quite good,
>> so it is possible to run most common Windows apps under Linux.

>I would be loath to wait around for an emulation ...

I've found most apps run *faster* under Linux, especially when you're
running several of them at once. Linux's pre-emptive multitasking works
much more efficiently than the Windows kludge. What is emulated is
the Windows or DOS or CP/M API. Because Linux interacts more

efficiently with the underlying hardware than Windows drivers generally
do, that's generally faster than when running native under Windows, even
with the overhead of call translation.

Programs still execute as native apps when they aren't making OS system
calls, of course. You're still on an Intel platform. Emulation does *not* mean
processor instruction set level emulation, except for the CP/M emulator. That
would slow things down except that you're emulating a 4 MHz Z80 on a
200 MHz Pentium Pro, so even emulated, most CP/M apps run faster too.
Naturally, native unix apps scream, and most of them are *free*, and many
are so good that you'll find little need to use DOS or Windows apps.

The only thing that can get dicey is trying to use a DOS or Windows app
which expects to talk directly to special hardware. In that case, you have to
do some configuration of the virtual machine environment of the emulator to
either simulate direct hardware access or actually give direct hardware access.
The latter can be non-trivial at times if interrupts are involved.

An example of this is using some of the cheapy EPROM burners. I keep a bootable
DOS partition on the primary disk for things like that rather than going to the trouble
of setting up the emulator to handle it. (Linux automatically installs a boot manager
called lilo so you can easily boot DOS, or any other OS you may have loaded in
another partition, when necessary.)

There is only one link as far as ARP and TCP/IP are concerned. Netrom has its
own mechanisms for determining link quality and making routing decisions internal
to the Netrom network. That's of no concern to the higher level internetting protocol.
It treats entire alien networks simply as a single link in the larger internet.

Here is what I have found after a lot of years using computers on both vhf paket and hf rtty/amtor/pactor...
My best results have come from several items...
1. keep the computer gear on one side of the desk and the rigs on the other side...a lot of hf hash from my computer gear is being sent by the vidio cord from the pc to the monitor.
2. judicious grounding
3. Get a good power strip...I run a pair of Isobars...one for the computer and another for the station (p. s. the computer side also has provisions for the telephone jacks...it keeps the rf from the hf station out of the telephone nicely)

My NEC 3FGe monitor is right along side of my Ten Tec Corsair II...I get very little hash...

Yup, I couldn't agree with you more; OS wars ARE for idiots. I run both DOS/Windoze right along side Linux with no trouble. I have three machines, two being a simple collection of pieces and parts gathered from various places. One is my main system which houses both Linux and DOS. The other two are total Linux. Of these two houses all my Linux, AX25, TCP/IP stuff which runs TNOS. I have two DRSI Type2 cards and Kantronics KPC-3 tnc configured into this system. All three are networked using cheapo $25 NE2000 ether cards.

My interest in NOT to incorporate this into the Internet, but have done so quite easily. My main interest is in AX25-TCP/IP networking. I managed to drum up some interest here in NE Oregon. We have three amateurs here tinkering with Linux and AX25. Two of us have managed to configure enough to test pinging our two systems. Needless to say, at 1200 baud our systems captured the frequency with a vengence.

No, this is not anything near what other folks around the country is doing, but in our little neck of the woods, it's the best we can do considering the current limitations of the existing network. There IS interest and movement in the AX25-TCP/IP direction. Just takes time and money.

Just thought I'd pass on an example of a "solution" on to you. Linux is the only OS with AX25 support BUILT IN! It has world wide support. We are but a very small colletion of individuals here working with this stuff. Linux WILL be a major player in correcting many of the current AX25 networking problems we amateur radio packet nuts are experiencing today. Sorry to hear you choose to remain behind, but I certainly understand the effort required to begin the first step.

Mike, N7KMJ

>
> wars are for idiots.

Yeah its too bad that arcane OS can RealAudio encode a 70Meg audio file that the supposedly secure/stable Windows NT 4.0 platform with NO OTHER programs running crashes completely on (back to bios, not even the BSOD, and it far blows 95 away in stability), while Linux is running netscape, an xeditor and playing a CD. Simple fact is, a user program in a Linux environment can't get to supervisor mode accidently, as it can in Windows NT, as the Windows security paradigm is completely backwards from any existant system today. Maybe you should actually try Linux before you dismiss it as arcane when compared to crash-and-burn systems like Windows XX/X.X. If you have tried Linux then explain the problems that caused you to think of it as a arcane OS.

I guess arcane would also include the ability to load and unload drivers on the fly, a feature not found in 95 or NT (they load everything or nothing, and a reboot is required to start new drivers, yeah, really modern compared to arcane Linux). It can also emulate a Novell server, a Microsoft server, and a NFS server, all simultaneously. Still arcane? Or how about the fact that Linux is proven to be a much more reliable high load web server OS than NT over the net? One of the basic OSs reliably serving the web, but you call it arcane. And how about the human readable text configuration files of Linux? That brings to mind another problem of windows. The registry. A sure fire way to lose everything in one mishap.

Not to mention that Linux proves to be more stable than NT or 95, while still having a wide open architecture, very suitable to hams, so that device drivers can be written by anybody who wants to read how to do so. With NT, you must pay $1000 for the device driver kit, then pay MS more money to test and certify the driver before you can distribute it.

I would like to know reasons for why you make these claims about Linux. About why its arcane, and a waste of time. Don't take this as a opening move in a OS flamewar, but as a request for a description of your reasoning that allowed you to come to the conclusion that Linux is a arcane OS.

If you would have gone to the TAPR page, www.tapr.org, you'd have found links to follow. Or if you had used any of the net search engines, they would have returned you a list of pages. Or you could have gone to the directory page of Ham Radio Online. Etc. No more than a couple of minutes of work would have found for you http://hydra.carleton.ca/articles/hispeed.html and much much more. The net is a wonderful resource, but like the library, you need to learn how to use it. It isn't going to spoon feed you pap like passively watching TV or reading a ham BBS. You have to make *some* effort yourself.

>>No, this has nothing to do with diskless workstations. Consider the web

>
>Why? If it isn't even available on ONE computer, adding more
>computers isn't going to make any difference.

As I noted, TAPR has the latest conference sessions in Real Audio format so that you can listen to the presentations just as if you were there. The earlier Proceedings are available only on paper, but you should buy them anyway to support the DCC. Much of the material presented at the conferences does exist on the web, however. For example, Karn's papers are on his web page for downloading. Many

of the other presenters also keep copies of their papers online. And
many of them have kept the papers updated with their more recent
work, so you aren't just reading historical papers, you're also getting
the most recent work. (And no, I'm not going to spoon feed you the
URLs. Do some work yourself. That's the only way you're going to
learn how to properly use the net resources.)

I don't think that's generally true. And I know it isn't true for our people.
They've spent countless hours driving all over hell and creation to speak
at club meetings, put on presentations at hamfests, or just going to people's
houses and showing them how to hook up their equipment. They wouldn't
keep getting support calls if they weren't providing support.

>>feedback, the users are the test loads on the system, but much of it isn't.

>
>You must have a lot of dumb hams in your area, and a severe shortage
>of Elmers.

We certainly have our share of willfully ignorant users in our area, and I don't think that is atypical. But we have a large cadre of people who are willing to go the extra mile to try to bring people up to speed, even those who refuse to open the manual which came with their equipment. But there comes a time when enough is enough. If people won't even make a *minimal* effort to learn something, after having it explained to them again and again, we can't afford to keep going to their houses and holding their hands forever. That's particularly true when, after we do get them running, they spend all their time abusing the network and carping about the services it provides without raising one pinky to pitch in and work to fix what they don't like.

>man by adopting your attitude.

But we aren't a commercial enterprise. We don't care about getting rich on the backs of a bunch of clueless users. Bill Gates has confirmed PT Barnum's maxim that there's a sucker born every minute. But as amateurs we aren't out to fleece the rubes. 97.113 says we're not to even try.

We're an experimental technical service with a charge to promote self-training and self-directed education. We've led the horses to water, if they refuse to drink, we're not going to abandon our own experiments and education in order to force feed them. They've got to *want* to learn or it does no good to teach.

>Phoenix on July 4.

Perhaps, but you want 2,000 active amateurs and 1,998,000 *users*.
If we had 2,000,000 active participating amateurs fullfilling our charter
goals, we wouldn't be concerned about hanging on to our bands. But we
don't have that. We have a relatively small cadre of people doing things
which address charter issues, and a much larger number parasitically
living off what those people are doing. And you want even more of those
parasites. Gresham's Law tells us how that turns out.

>>it to good purpose, squatters don't matter much. It is true that the safest

>
>You think hams would leave 2 meters or 20 meters if told to leave in
>favor of some BigBucks corporation? Most would, maybe. Enough
>wouldn't that it'd be a problem for a long time.

It would be BigBucks Inc's problem, and they'd have the resources to
deal with it. As example, BellSouth Mobility has 50 times as many technical
people tracking down cellular fraud as the FCC has Field Engineers, and
they've got 100s of times as many lawyers on retainer just waiting to sue the
pants off someone for trespassing on their network. But meanwhile, those
of us who still have a shred of respect for law would be gone, and gone with
us would be any opportunity to do the experimental work and self-education
we are chartered to do.

>>>Sorry to break this to you, Gary, but everybody is clueless in some

>too. I really don't understand why you can't see this.

I can see that making amateur radio into AOL isn't the solution. I don't know why *you* can't see that. We don't need more *users*, we need more *doers*. That's a very different group than the one AOL is trying to attract.

>>The sort of people we want to attract to packet networking are those who
>>really want to do packet networking because it is interesting and challenging
>
>Yep. But you've got to find them first, and demonstrate what fun they
>can have being a packet pioneer. Nobody's doing that. When packet
>first started, there was lots of that sort of thing.

Indeed, but packet isn't new anymore. It is a well established, and somewhat dowdy in most places, branch of amateur radio. It has little novelty value anymore, and in many areas has little utility. Do you really think we can pull *users* away from AOL with that? We can't match what AOL offers the *user*. What we can offer is the chance to experiment with, and learn about, packet networking hands-on, which AOL does not offer at all. I keep putting that message out, and you keep pooh-poohing it, calling it elitist. Well it is elitist, and that's a *good* thing. I want the top
10% of the bell curve, not the bottom 50%. We already have more than our share of them.

>> If they

>viewpoint. Too bad that attitude is contributing to the slow death of
>packet radio, and arguably ham radio itself.

In actual fact, we have not. And Gresham's Law is insuring that the "undesirables" are pushing out, or discouraging from entering, those we do want. It is true that I'm not interested in recruiting *users*, but I am interested in recruiting *participants*. Unfortunately, the number of users far exceeds the number of participants.

Source record: 28860
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.packet

My program, BTRAKR, needs some testers.
Two versions of BTRAKR are now working.
BTRAKR01.LHA for Amiga, is on aminet.
Version 02 for Amiga will *soon* be on aminet.

Version 01 for MSDOS seems to work, but I have not uploaded it
anywhere yet. Anyone care to suggest where to?
I can email either 02 for Amiga or 01 for MSDOS.
The program is freeware, but I do ask that anyone who uses it
send me email about its accuracy (or lack thereof).

For now my preferred email address is:
bobdavis@cadvantage.com

BTRAKR attempts to predict the landing location of a helium
balloon, such as that flown by Amateur Radio operators.

3864. DPK9600 U6 chip

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-01 00:00:00 UTC
From: Carl Black <cblack@capecod.net>
Message-ID: <33B93FB9.4077@capecod.net>
Source record: 28861

Hello guys,

One kindly ham out there faxed me the schematic for a DRSI DPK-9600 which helped me isolate a rx data problem to IC U6. This chip, an MX489J (also called an F9246 on the diagram) is bad. It may be a custom chip made for DRSI just for use in the 9600 tnc. I have made 3 calls to DRSI in Clearwater, FL where I only get an answering machine. A voice calling itself Andy DiMartini (D'Martini?) says to leave a name and number and they will call back. No call backs yet. I sent them a fax requesting info on where to get the required chip. No fax yet. I have called Digi-Key, Mouser, Allied Electronics, etc. None have any cross-reference to the required chip. If anybody out there knows where to find an MX489J (F9246?) or how to get through to Digital Radio Systems, Inc..... HELP! When DRSI got out of the ham market, I feel they still have an obligation to support the products they sold. Our packet network group must have 15 or 20 DRSI DPK-2s and about 5 DPK-9600s. We paid some pretty good bucks for the equipment and now they are all awaiting the same fate of the current 9600 problem, to become junk because the manufacturer walked away. So much for business integrity. If you own any DRSI equipment, pray that it never smokes on you. Thanks for any help on the chip.

Greetings,

I have recently made available the N9IPV Spectrum Analyzer for the
Yaesu FT757 style rigs.
I would like to extend the same software for owners of the following
rigs...
Yaesu FT 747 style
Yaesu FT 767 style
Yaesu 980 style

Since I do not own any of the above rigs, I cannot do this unless an
owner of each of the following rigs will come forward and send me a
copy of the page(s) in your manual that describe the communication
protocol and a diagram of the front panel.

In return, I will give you a copy of the completed software.

E-Mail me for my address please. dthimm@newnorth.net

If you would like to see the features included in the FT757 version,
please visit my website and download a copy of the software at:

http://www.newnorth.net/~dthimm

Thank You and 73
Dan T.

PMFJI, but there are serial ports that are capable of much faster speeds
than 56kbs. The Cybercom Pro serial board from SIIG will do 460 kbs and
the Hayes ESP board will do 961kbs. My problem is I can't find anything
to connect to either board (that I can afford) that will take data as
fast as either boards' ports can supply it. If I ever subscribe to ISDN
or ADSL service or if
900mhz SS radio modems become available (affordable) then maybe I can
realize the serial ports full potential.

It depends on how much software you want to write :-)
Your Sparc already has a Z8530 builtin, eg. it already has
what PC users buy with an SCC card :-) I assume it would be
quite easy to: connect a baycom ser12 or a DF9IC (or G3RUH)
modem to the SCC; write a driver for an AX.25 stack such as
NOS or WAMPES, using the HDLC driver in Solaris (see man zsh).

We did that for a point to point wormhole. Since it isn't packet switched,
it isn't a very flexible or general solution, but it certainly is fast to have your
own dedicated cross country T1 to tie two MANs together. The free capacity
we were using dried up, however, so we lost that link. We've had a few
opportunities to get others, but it is strictly on an as available basis, and
is limited to only one pair of fixed points.

The advantage of linking via internet is that it is a switched network, so you aren't
limited to just one pair of fixed points per hardware link, IE you can maintain a number
of wormholes with the same hardware connection. The downside is that it can
sometimes slow down due to congestion. I haven't found that to be a major problem
as yet. The most likely bottleneck is at the ISP local loop, IE at the modem server.
We have an ISP who allows us direct trunk access (direct to his ethernet where the
trunk TA lives), so we mostly avoid that bottleneck.

It means some sales droid went to the PT Barnum school of copy writing.
Most of the so-called "9600 baud ready" radios *aren't* 9600 baud ready,
and can't reasonably be made to be ready. There are a very few exceptions.
The Tekk KS900 is one exception, and the Azden PCS9600D is another.
Both really are 9600 baud ready. The Tekk KS1000 can be modified to
be 9600 baud ready. The IC-820H is sort of 9600 baud ready, IE it will
work, but not as well as it should. Nothing Kenwood, Yaesu, Standard,
or Alinco advertises as 9600 baud ready will really work properly at
9600 baud. It is just advertising smoke.

If you have a Sparc, and are prepared to write software, you don't need a TNC.
A TNC is a modem plus PAD plus serial terminal driver. The Sparc can do the
PAD (Packet Assembly Disassembly) function, can handle all protocol issues,
and you don't want to waste it as a mere terminal emulator anyway. So all you
need is a modem. That can be as simple as a single chip or as sophisticated
as the WA4DSY 56kb RF modem.

(Note, there's now a version of Linux for the Sparc. That has packet drivers
already built in. If you don't want to give up Solaris, you can at least use the
Linux code as a template for the driver you write for Solaris.)

For HF, you'll probably want a DSP modem to handle that noisy fading channel.
For VHF/UHF, DSP is overkill unless you're planning to operate the amateur
satellites. Note that you can get by with an analog modem on HF. That could
be the old Hoff design using 88mH toroids, or one of the newer designs using
opamps or switched capacitor filters. The old Hoff design is pretty darn good,
often putting the newer filter demod circuits to shame, and it is dead simple
to build, and cheap. A good DSP unit will beat it though. The problem is in
knowing what is a good DSP unit. That depends so heavily on the ability of
the DSP programmer that you can't just compare hardware to determine if
it is any good.

Finally, if you're a good programmer, you might want to get the TAPR DSP93
kit. You can program your own modems for it. You might even prefer to get one
of the DSP evaluation kits from Analog Devices, Texas Instruments, or Motorola
and program your modem on one of those (they're cheaper, and in some cases
more powerful than the TAPR kit). There is quite a bit of code floating around for
all of these, see the TAPR website, so you won't have to start from scratch. If you
want to program, I can recomend this as a good way to go. You'll be able to keep
your unit updated as methods change in the future.

But if you still want a TNC, and you want HF as well as VHF/UHF, you can look at the KAM or the ex-AEA products now handled by Timewave. The KAM isn't DSP, a couple of the ex-AEA products are. Be aware that these units will likely be obsoleted in the future because their on-board processing power isn't really up to the demands of more advanced methods.

Packet is the primary digital method on VHF/UHF, and any cheap TNC can handle it at the low speeds now in common use. But at HF, packet is not very good, and other methods such as PACTOR, PACTOR II, GTOR, or Clover II are used. The KAM can handle PACTOR and GTOR (as well as RTTY, AMTOR, and Packet), but note it uses analog filtering and not the more powerful DSP. The ex-AEA units can handle all of those except GTOR (that's a Kantronics proprietary protocol).

Stepping up a level, HAL has a couple of DSP options for HF. You can't use the ISA plug in P-38 in a Sparc, but you can use the 4100. That does PACTOR, RTTY, AMTOR, and Clover II. Clover is a very high performance HF method. It is proprietary to HAL. Or you could consider the SCS PTC II. This is another very high performance DSP box which supports PACTOR, RTTY, AMTOR, and PACTOR II. PACTOR II is another very high performance HF method, proprietary to SCS. The PTC II can also be fitted with optional daughter cards to do packet. (We're talking serious bucks for the loaded PTC II though.)

There are more Clover II units in the field than PACTOR II units, but usage of both is growing. It is hard to say which will eventually dominate, or whether both will be replaced by something else altogether. In any event, you will want to be able to do PACTOR and RTTY. Neither is a very high performance method, but both are in very widespread use, and aren't likely to disappear from HF for many years to come.

Haw! Har! Giggle ... "Unix is mainstream" ...

Steve, you might want to come out of your cave and read the trade
journals a bit ... "Unix is mainstream" is not a statement that
has ever made much sense, and certainly makes little sense at this
time. Do a reality check, visit your local library and read some
trade journals and discover where "mainstream" has moved to in the
past few years. It ain't Unix ...

But Steve, you are at an .edu site, is it not so?

The .edu world has seldom, if ever, had any clue what "mainstream"
might be.

Computers don't radiate much. Albeit, enough that someone could pickup
your program a half mile away.

We have to remember square law. The signal falls off as the square of
the distance between the emitter and receiver. I have a CHEAP 386-16
and was hounded by EMI until I connected the receiver to the antenna via
coax rather than a simple lead in. Most hams probably are already doing
this. Just don't overlook the obvious.

If you can hook up the computer and the receiver to seperate breakers
you will increase the distance over a very lossy transmission line.
Several feet may be enough to attenuate transmission via the power
line. Using the same duplex outlet is the worse case for EMI.

There are several vendors of EMI proof computer cases for military and
aerospace applications. Unfortunately, you probably could buy a Pentium
pro for the cost of the cases.

>packet radio network. Check for WP entries, they ain't there.

I find this very interesting. A user of "yours", N7QQU just sent me
a message today and commented that he could not find my packet address
in "YOUR" WPs, even though I sent him a message not two weeks ago.

I've been on packet for years. One other point I'd like to make; many
BBS sysops have their system set to HOLD any bulletins for content.
I have no problem with this, however, it does place limits to what may
be said in the packet BBS forums.

Your arguments are not holding water Hank, I'm sorry say. And just to
save you some typing... this has nothing to do with nothing.

Mike, N7KMJ

>on the internet and the web. They are voting with their feet for that sort
>of access. We have to offer them equivalent functionality, or something
>even better, or they have no reason to bother with us.

The only really cool thing that is going in amateur packet right now
is APRS. If someone was to take this idea, clean it up [remove the
irrelevancies, etc], fix it up [formalize the broadcast "protocol", such
as it is], generalize and abstract [think in terms of sensors, not just GPS
receivers], synthesize the result with something like the Distributed
Interactive Simulation protocols [a military-inspired battlefield simulation
protocol], and link to some better form of distributed database system [any
good examples beyond the DNS?] and wrap the whole thing with UDP [or
whatever], and the next Internet "killer app" [excuse the descent into
marketingspeak] could be in hand.

And all this *could* be developed and tested in Amateur Radio land.

Too bad you are not allowed to connect with the rest of the tcp/ip
network in Oregon. There is quite a bit of activity just one network
hop from you, but access to it has been denied.

> Just thought I'd pass on an example of a "solution" on to you. Linux
> is the only OS with AX25 support BUILT IN! It has world wide support.

> experiencing today. Sorry to hear you choose to remain behind, but
> I certainly understand the effort required to begin the first step.

... and on and on and on ... about how your OS is better than my OS.

Mike,

If you really want to help move tcp/ip networking forward, you
would get the lockouts removed from the nodes local to you, and
then you could join the rest of us using tcp/ip.

It's a lot of fun.

And you DID forget to mention the fact that the network is 9600
baud over your way ... at least the parts I'm allowed to connect
through are 9600. Nice and fast. http works pretty well across it.

Notice that I didn't mention which Operating Systems we use over here.
It doesn't matter. Only the applications matter, and we do a LOT
more than simply ping each other!

Want to give it a try?

Try http://www.w0rli.ampr.org, or if your DNS doesn't know about that
address, try http://p90.w0rli.ampr.org. If your DNS doesn't know
about
THAT address, you are in deep doo-doo.

Like I said .. there was a global packet network.
All the data that moved across this network used AX.25 packets.
You want to play semantics, this discussion cannot go anywhere.
Was this network "fully connected on a real-time basis?" No.
Could you connect to "anyplace on the planet?" No.
But it was (and is) global (i.e. the network can, and does, move
information to nearly everyplace on the planet.)

But heck, you can claim it doesn't exist all you like.

I'd rather build it and use it instead of whining about the fact
that it is not perfect, is not everywhere, is not fast enough.

Gary,

You need to check your dictionary.

You also need to get back into the real world long enough
to discover what hams happen to CALL the network of forwarding
stations which makes up the global ham radio network.

You don't like what they call it, convince 'em to call it something
else.

And like I said; you are not using it, nor is n8gnj nor wa6vse.

Hard to take you seriously when you complain about something you
do not use ... and seem to know very little about.

Never had an RF WAN?
Funny, I remember one many years ago.
It was on HF.
Ain't there anymore, is it.
Killed off because it was bypassed via commercial network connections.

But heck, it didn't handle "tcp/ip packet switching" so you probably
were 1) not around when it existed; or 2) didn't notice it was there.

Last time I used it was about 4 years ago ...

Note that he has a Sparc. That can directly bit pump a 56 kb modem via
its serial port. So can a Mac, they aren't as crippled as PCs in the serial
department.

I disagree that there is no increase in capability with DSP. There certainly
can be, but it is dependent on the skill of the fellow who wrote the code.
Both the HAL and SCS DSP boxes have good code running on them, and
are quite a bit better than anything done with analog modems.

There goes absolutely any respect I had for you . . .

Unix is mainstream when it comes to engineering whether it be in edu land or out. NT has a snow ball's chance in hell of ever being as stable on graphical applications such as CAD, etc. as an X system. Ditto for web servers.

A fellow club member here at State was talking to me last night. I had pioneered efforts here in my department to move to NT (from 95). I like NT, its a good desktop business OS, but it has nowhere near the protection, well thought out security system, or stability of UNIX. I will welcome the day when it does, as the crowd I cater to requires a OS that can run Word and Excel. Right now, you cannot run a locked down workstation with any of the windows apps. There always has to be a compromise between security and software useability. Under Unix, its a install and go proposal, because it was built with multiple users in mind, and programmers are expected to write software that way.

Anyway, I told him I dropped NT like a hot rock in favor of Linux for my own system. He couldn't understand why. I explained simply . . . I have 128Megs of RAM, I had NT, and I had the NT real audio static file encoder for making files to include on web pages. Well, I opened a 70Meg file with said software, and WALLOP! Instant reboot. I never thought real audio could be a test for OS robustness, but what do you know? And to add to this case against NT stability, NT has problems whenever the wowexe program is running (windows on windows services). Let's not even get into 95 here, that is a joke of an OS, but a very good marketing ploy.

So, I run NT at work where I have to provide a business environment type computing lab, but for real stuff like writing programs and making things that are secure on a multiuser machine for myself and doing things that I like to do and not things that Microsoft would like me to do, Linux is a much better choice (or a commercial UNIX). And I'd like to see the day when NT could run a enterprise even closely reliably as a Novell or UNIX server. Its just not gonna happen any time soon, as Microsoft tries to extract more speed by keeping the graphics drivers in kernel mode. If NT is to be a server platform, they shouldn't worry about screen redraw speeds. But I don't see how they could have even taken that as a reason to make such an error in these days of 2000 dollar scsi systems with 200MHz Pentiums and 64Megs of RAM, I think it was a really stupid move, as these systems are fast enough to compensate

for any overhead that may have been caused by treating the graphics interface as a user program.

The trade mags may have you believe that NT/95 is the head of the pack, but its really just an inside joke of theirs to promote Windows. Windows may dominate on the desktop, but the servers standing behind it all is typically a Novell or Unix monster that can chug along for months at a time with absolutely no intervention, no matter what PCMag says. Plus, Win 95 has still not enjoyed the market share for the *desktop* that old Win 3.1 has.

BTW, those trade journals wouldn't be ZiffDavis that you read would they? They have a special interest in Microsoft or either vice versa. One owns stock in the other. But then again, just turn to page 242 of the July 1997 issue of PCComputing (a ZiffDavis publication that believes MS is the best thing since sliced bread) and Lie 5. Even they are forced to admit NT isn't everything its cracked up to be.

And not to further shoot down your simpleton ideas about mainstream computing, but Alphas are coming on the scene. It is the obvious brutal Pentium killer chip, no votes needed, and thanks to MS. When people find out how crappy MS optimizes code for the Alpha vs. the Intel boxes, and the speed a optimized OS like UNIX can bring them, you may see Unix make a resurgence into the desktop world. Its going to be hard for MS to cover the all too clear fact that the ALPHA is faster than the Pentium, and *Holds A World Record*.

More facts just in:

Did you know that Microsoft counts copies of Windows sold as those installs setting on machines in manufacturers backstock? Well Linux is only counted as per installed copy . . . and there are 6 million of them. Think about it . . .

Have a nice, sheltered day,

From: Carl Black <cblack@capecod.net>
Message-ID: <33BB1123.3989@capecod.net>
Source record: 28803

A few days ago I was seeking help in locating a MX489J chip for
a DRSI DPK-9600. Thanks to Burt, VE2BMQ and Alan, G3KFN I was given
some leads that led me to MX-COM the chip manufacturer's web site.
While MX-COM only accepts a minimum order of $250, an MX-COM
distributor, CDI in Annandale, VA did accept a single unit VISA card
order. So with the help of the usenet and helpful people, I
will hopefully have a major link on our packet node back in operation
sometime next week. In case anybody ever has need of an MX-COM chip,
their URL is www.mxcom.com. All information is at this website along
with a list of products, distributors, prices, etc. Until the MX489J
went kaput in the DPK-9600, I had never heard of MX-COM and I've been
around awhile. BTW, the MX489X has been replaced with an pin for pin
upgrade the MX589J. Burt pointed out that the MX589J is also used in
the KPC-9600. Alan, said that in the UK the same chip is an FX589.
Hope this saves somebody the hours and days I spent tracking it down.
DON'T DEPEND ON ANY HELP FROM DRSI, the Digital Radio Systems, Inc.
former maker of the DPK tnc series.

I have no current packet experience but want to start.

APRS is of special interest both with mapping and weather reporting.

Can anyone point me in the right direction to find out how to hook up a
weather station to send via packet.

Thanks, 73

Tim

: past few years. It ain't Unix ...

I don't have a clue as to what you could be thinking of as being more
mainstream than Unix. I suspect you might be thinking of some DOS type
systems (Win 3.1, Win 95, Novell). I would agree these too are mainstream.
Maybe some older mainframe stuff e.g., VMS, MVS, etc.

But that isn't a complete accounting of what is, or is not.

: But Steve, you are at an .edu site, is it not so?

That's where I'm posting from. If you'd like I could post from my
Windows box to the ISP or other Unix accounts?

: The .edu world has seldom, if ever, had any clue what "mainstream"
: might be.

That's ridiculous.

Go to any ISP, Hospital, Government Agency, School, Library, Gas Station,
and look what's being used for the server. The days of Novell are over,
and administrators are jumping on the jobs that pay the best: Unix jobs.

Tell me what systems run Oracle RDBMS, and I'll tell you what's mainstream...

Not to bicker with those of my own side, but Novell is alive and running
hard. Novell enterprise servers by far are as reliable as Unix (though
you can use a Unix box as a workstation and server at the same time, but

why?), and Novell is encompassing everything within the NDS system, so as to make themselves unobsolete-able, and not only that, but it works well and makes things easier on the user. Novell is also helping to force the fat client 95/DOS/NT systems into a thin client type system, using NAL (Novell Application Launcher). This could be a primary key to the whole battle, a battle which MS yet is to put an entry into.

I see Novell as a business NOS and Unix as scientific/engineering OS, and I also see Novell quickly enroaching into the the Unix server market with NDS. NDS is already projected to move to complete TCPIP, at least thats what my sources tell me (the servers already run over tcpip so that NDS can communicate directory/service data world wide). I also see MS making everyone miserable by attempting to shift the scales by using their market power to make all competitors miserable with NT.

Later,

David - kf4mok

3893. Reminder: July 19 DMARC Meeting

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-03 00:00:00 UTC
From: Stan Staten <w3ink@erols.com>
Message-ID: <01bc8796$6b672fe0$b989accf@sstaten.erols.com>
Source record: 28806

Reminder: July 19 DMARC Meeting

DMARC exists to provide a forum where those amateur radio operators interested in the "digital domain" can network together to learn more about packet radio, TCP/IP, APRS and other digital modes. The DMARC organization has several on-going initiatives that are focused on developing tools and educational packages to assist more amateurs in getting exposed to this challenging aspect of the amateur radio service.

Are you interested? If so, then mark your calendar and plan to attend our next quarterly meeting which has been scheduled for Saturday, 19 July beginning at 1 PM. We will be meeting at the Prince Georges County Emergency Operations Center in Seat Pleasant, Maryland - conveniently located just 1.5 miles west of the Washington (DC) Capital Beltway (I-95) on Maryland Route 214. Turn right on Jonquil Street, go two blocks, then right again on Anchor Street. Go up the hill and park in the visitor's parking lot. Talk-in on the KA3LAO 147.18 MHz (+)2-meter repeater. No time for lunch? Come right on over anyway... we will be serving sodas and refreshments!

Ongoing topics of discussion will include the latest news on the various band plan changes to be implemented over the next 6 months; actions now on-going to install high speed backbone nodes in the DMARC operating area; and the latest scoop on DMARC educational programs. Want more info? Then click your Internet web browser to WWW.QSL.NET/DMARC and get the very latest we have to offer on a number of digital topics. Those of you on packet just have to watch for the DMARC@MDCBBS and DMARC@VANET bulletins on your friendly neighborhood BBS... WHAT - no local BBS! Hey, how about starting one up then. Don't know how... then send an e-mail to DMARC@QSL.NET and we'll help you get started.

We hope to see you on July 19th... we need your support to help make amateur radio digital operations grow in the mid-Atlantic area!

73, Pete (WA3UMY), DMARC PIO

Well, I work in this field. We see our customers moving away from Unix,
and toward Windows for some very good reasons; price/performance and
availability of software. Check out products from any of the suppliers
and you will see what I mean (Mentor, Cadence, Viewlogic, Synopsys,
Intergraph, SDRC, not to mention Orcad and the other "traditially
Windows"
products.) Sure, you run your larger simulations on "that big Unix
server or mainframe in the back room."

> A fellow club member here at State was talking to me last night. I had

Yup, that is all true, and unimportant.

> I

Yup.

What does the above have to do with what the engineering design customer
is doing? Nothing.

> So, I run NT at work where I have to provide a business environment type

In the real world, Linux is not yet a choice. Perhaps someday when there
is the same level of support provided by HP, Sun, DEC, but not now.
We have zero (not one) requests from our customers to support Linux.

> And I'd like
> to see the day when NT could run a enterprise even closely reliably as a
> Novell or UNIX server. Its just not gonna happen any time soon, as

You need to get over to that library and read the trade journals.
A lot has happened in the "real world" over the past year or two.
NT is running a LOT of mission-critical applications in a LOT of
companies now.

> Microsoft tries to extract more speed by keeping the graphics drivers in

So you don't beleive what is reported in the trade press?
Ah! A religious fanatic. Never mind, ignore everything I wrote.

And how does NT compare against Unix market share?
You will be surprised ...

> BTW, those trade journals wouldn't be ZiffDavis that you read would
> they? They have a special interest in Microsoft or either vice versa.

Hi,
I have just cut the diode that lets you tune the radio over a wider range
it will read out 140.000 to 149.990 but will not lock below 144.000
i only want to be able to tune down to 143.625, any help or further mods
will be of great use ....
Kenwood Tr751e is the beast in question

This is not one of those "Get Rich Quick Schemes" or "mail-order
Schemes". But enough to pay off your debts and who knows, you could be
test driving the new Mercedes in the next three months. If you're too
eager to read what this is about then go right to the Instruction Section
at the bottom of this article.
READ ON. If it doesn't make sense, read it again and again until it
does!

****

Hello! I've got some awesome news that I think you need to take
two minutes to read if you have ever thought "How could I make
some serious cash in a hurry???" , or been in serious debt,
ready to do almost anything to get the money needed to pay off
those bill collectors. So grab a snack, a warm cup of coffee, or
a glass of your favorite beverage, get comfortable and listen to
this interesting, exciting find!

(If you're reading this on-line, I suggest that you QUICKLY
download it to your hard drive FIRST, just in case some do-gooder
takes it off the news board. You can always read it with a text
editor, like Windows Notepad. Also, you will find this copy on
your disk to be most useful, as you will later see. Just use the
File: Save As command.)

Let me start by saying that I FINALLY FOUND IT! That's right!
I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes
like multi-level marketing, mail-order schemes, envelope stuffing
scams, 900 number scams... the list goes on forever. I have tried
every darn get rich quick scheme out there over the past 12 years.
I somehow got on mailing lists for people looking to make money
(more like 'desperate stupid people who will try anything for
money!'). Well, when I was a teenager, these claims to 'get me
rich quick' sounded irresistible! I would shell out $14.95 here,
$29.95 there, $24.95 here, and another $49.95 there. I had maxed
out my new Circuit City Card AND my Visa... I was desperate for
money!! So, I gave them all a chance but failed at every one of
them! Maybe they worked for some people, but not for me.
Eventually, I just tossed that JUNK MAIL in the trash when I got
the mail. I recognized it right away. I can smell a money scam
from a mile away these days, SO I THOUGHT.... I thought I could
sniff out a scam easily. WAS I WRONG!!

...I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to GET CASH FAST!! I thought... "Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50,000 IN CASH WITHIN 4 WEEKS! Well, the more I thought about it, the more I became very curious.
Ok, so the $50,000 in cash was maybe a tough amount to reach, but it was possible. I figured that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail' for you e-mail fanatics) a ten dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me To Your List." I then removed the first person on the list, then i moved #2 to #1, #3 to #2, #4 to #3, # and then moved #5 to #4, and I put my name in position five of the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in... prepared to maybe receive about $1000 to $1500 in cash or so....

But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world - Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $32,343!!! I couldn't believe it!!

I now have a brand new white Audi A4 to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 one dollar bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five 1 dollar bills to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY, EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE ONE DOLLAR BILLS IN THIS AMAZING
MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the most detailed, yet straight-forward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

****
*** (THE LIST OF NAMES IS AT THE END OF THIS ARTICLE.) ***
OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed. (Not that it's difficult or anything.)

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my name to your list". This creates a service out of this money making system and thus makes it completely legal. You are not just randomly sending a one dollar bill to someone, you are paying

one dollar for a legitimate service. Make sure you include your name and address. I assure you that, again, this is completely legal! For a neat little twist, also write what slot their name was in: "You were in slot #3", just to add a little fun! This is all about having fun and making money at the same time!

2. Now fold this sheet of paper around a one dollar bill, (no checks or money orders), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will ensure its arrival to its recipient. THIS STEP IS IMPORTANT!! (Otherwise, some unscrupulous mail delivery person may see what's inside and start helping himself to all the thousands of envelopes arriving!)

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up one slot on the list. Position #2's name will now move to the position #1 slot, position #3 will now become position #2, #4 will be #3, #5 will be #4. Now put your name, address, zipcode AND COUNTRY in position #5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin boards, message areas & file sections as possible. Give a catchy description of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!! If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way

they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. DON'T ALTER THE FILE TYPE, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. (Do NOT use the WordWrap option. It will screw the margins up!) If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file, i.e. CASH.TXT, and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever. Just make sure it represents its true feasibility, NOT something like... "Get one million dollars flooding in your mailbox in two days!" You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON ITS WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

****

What that means simplified is:

1) Send $1 to the people on the list

2) Put your name on list

3) Post list everywhere you can

4) People send money to you because your name is on the list

GOT IT!

****
THE NAMES LIST THE NAMES LIST THE NAME LIST

Hank Oredson <hank_oredson@mentorg.com> wrote in article
<33BBD3B6.3AAC@mentorg.com>...
> Well, I work in this field. We see our customers moving away from Unix,
> and toward Windows for some very good reasons; price/performance and
> availability of software.

I also work in this field, and what I see is the workstation going NT or
Win95, but
the Server remaining Unix. NT and MS-SQL servers are for very small
businesses.

> In the real world, Linux is not yet a choice. Perhaps someday when there
> is the same level of support provided by HP, Sun, DEC, but not now.
> We have zero (not one) requests from our customers to support Linux.

I agree, the linux base is quite small. But we were talking about an
Arcane
operating system, not a version of it.

> You need to get over to that library and read the trade journals.
> A lot has happened in the "real world" over the past year or two.
> NT is running a LOT of mission-critical applications in a LOT of
> companies now.

OK, went downstairs, grabbed the June 16th 1997 issue of
Information Week. Ummm, coffee... The cover article is "A Question of
Value."
Flip to page 14, hmmm, oh oh... Read the article. The final paragraph:

"While the new versions of NT and SQL Server will let users do more
enterprise tasks on Intel-based hardware, it may turn out that the cost
savings from doing so are slimmer than users have come to expect.
One of the major factors in NT's favor--its low cost--is about to get
more complicated."

The article quotes a microsoft plan to sell the NT/SQL system for $12 k.
"Pete Starzewski, a network systems administrator with Green Bay
Packaging Inc., ... recently compared NT and Unix ... chose a $35 k
Unix machine from Sun ... 'It's an application we felt had to be running
24 hours a day, seven days a week, for months at a time.' ... Starzewski
believes add-on costs make NT more expensive than it first appears.

Your assertion that "NT is running a LOT of ... applications" doesn't
really
tell us why Unix is arcane though. It just argues that NT is not arcane,
and
Unix is, I guess??

Hmm, oh well...

Nothing that satisfactorily covered more than half a state.

>Funny, I remember one many years ago.
>It was on HF.
>Ain't there anymore, is it.
>Killed off because it was bypassed via commercial network connections.

No, it died because of lack of capability and functionality. I remember when
one coud do a two hop on HF, via Panama, but performance was dismal.
Throughput was pitiful, and resends plentiful. Three hop and greater never
worked. And we can't make it better under current HF rules, probably not
under any rules we can reasonably expect to get either.

>But heck, it didn't handle "tcp/ip packet switching" so you probably
>were 1) not around when it existed; or 2) didn't notice it was there.

I was around, but it just wasn't useful enough to maintain a capability
to access it. Even the store and forward BBSers have realized that
for the most part, and have moved to point to point methods rather
than attempting to use HF packet networks to move their message traffic.
(Note two stations in direct contact aren't a packet network, even if they
use packet for the point to point link. It is still just point to point forwarding,
ala uucp, and with a link protocol not well suited to HF.)

What is there about the words "global," "network." and "packet" that
you don't understand? When I get a message from Moscow, Russia, bound
for Seattle on my _PACKET_ BBS via my _PACKET_ TNC, via a whole bunch
of other _PACKET_ systems in a _NETWORK that exists in many nations
all over the "GLOBE" then I gotta assume this is an excellent example
of a "global packet network." Or are you telling me that all this
stuff I've been doing for the last ten years isn't really _PACKET_
radio?

You're wrong. You know you're wrong, and no amount of dancing around
about some narrow(minded) definition of broad, general words can

obfuscate that.

Yes, yes, yes, I know all that. I was merely pointing out that not
everybody has access to all the resources that you have, or knows how
to use them. Most folks include a URL as a courtesy when giving a
specific reference, so the original research doesn't have to be
wastefully duplicated by others. Suppose that a dozen lurkers were
interested in that particular reference? Think how much time, effort,
and bandwidth would be wasted by all 12 of them having to go searching
for something that you already had at your fingertips. If you didn't
actually have the referenced URL, of course, that's a different thing,
but that fact could have been mentioned in your post, too.

I already know how to use them, thank you very much. Of course, my
skills may need improving, but how much better it would be if I could
improve them looking up things other than what arguably should be
already assembled at one central location? If you want to attract
people to your vision of the future of packet, it behooves you to make
it easy for them to find that vision, right? Or are you going to use
the CW advocates' argument that the difficulty of finding the
information acts as a filter to keep out those who are not "properly
motivated?"

>mass market consumer communications services.

And yet the FCC allows (and even encourages) _many_ things that are
ostensibly prohibited in that paragraph. As I said, the rules are
broad and vague for a reason. Everything not specifically prohibited

is allowed, in a free country.

Perhaps if they were really _good_ teachers, you wouldn't have so many
people needing support. "Active" and "willing" do not necessarily
equate to "good." Really good teachers are a very rare commodity, in
my experience.

>
>Perhaps, but you want 2,000 active amateurs and 1,998,000 *users*.

What I want is irrelevant. I merely stated a fact. Statistically,
the more hams you have, the more _active_ hams you will have.

>If we had 2,000,000 active participating amateurs fullfilling our charter
>goals, we wouldn't be concerned about hanging on to our bands. But we
>don't have that. We have a relatively small cadre of people doing things
>which address charter issues, and a much larger number parasitically
>living off what those people are doing. And you want even more of those
>parasites. Gresham's Law tells us how that turns out.

Double the number of hams, and you've doubled the size of that cadre,
or, at the very least, doubled its _potential_ size. You may have to
do a bit of effort getting the new folks interested and involved in
your part of the hobby, since you are in competition with a nearly
infinite number of other amateur activities that may have nothing to
do with a New Improved Packet Network.

>>You think hams would leave 2 meters or 20 meters if told to leave in

>we are chartered to do.

Not as long as there're any ham bands left at all. Your "paradigm"
(damn, I hate that word) of a small, elite "cadre" of technically
adept hams just doesn't justify us holding nearly all the frequencies
we enjoy now.

>>We are in competition with AOL and hundreds of other things for the
>>attention and money of young people, and to some extent, older ones

Never suggested that.

>know why *you* can't see that. We don't need more *users*, we need
>more *doers*. That's a very different group than the one AOL is trying
>to attract.

AOL wants customers. Ham Radio wants hams. Customers and hams are
people. (Well, some hams may not fully qualify, heh.) People have
limited time and money. Yes, we are definitely in competition with
commercial services for the time and dollar of those who wish to
dabble in the communications hobbies.

>>Yep. But you've got to find them first, and demonstrate what fun they
>>can have being a packet pioneer. Nobody's doing that. When packet
>>first started, there was lots of that sort of thing.
>
>Indeed, but packet isn't new anymore. It is a well established, and somewhat
>dowdy in most places, branch of amateur radio. It has little novelty value anymore,
>and in many areas has little utility. Do you really think we can pull *users* away
>from AOL with that? We can't match what AOL offers the *user*. What we can

Exactly. So where are the folks on the EXISTING packet network luring
people into the new, exciting world of the New Packet? Why would
anyone deliberately ignore a large reservoir of ready made customers
who already have been sold the basic idea you're selling?

>offer is the chance to experiment with, and learn about, packet networking hands-on,

>poohing it, calling it elitist. Well it is elitist, and that's a *good* thing. I want the
top
>10% of the bell curve, not the bottom 50%. We already have more than our share
>of them.

What you want is to decimate ham radio because it doesn't meet with
your approval. This attitude is no more enlightened than that of the
CW luddites. If you want lots of bandwidth in which to do your
innovating, you've got to have something to justify it. Without
bodies USING those bands, you cannot and will not hold what we've
already got. This seems so obvious to me that I can't see why you
don't seem to see it.

>>Well, from what I've been able to gather so far, you elitists have

>>undesirables is defined as anybody who doesn't share your exact
>>viewpoint. Too bad that attitude is contributing to the slow death of
>>packet radio, and arguably ham radio itself.
>
>In actual fact, we have not. And Gresham's Law is insuring that the

Perhaps not, but that's sure what it looks like from what you write.

>"undesirables" are pushing out, or discouraging from entering, those
>we do want. It is true that I'm not interested in recruiting *users*, but
>I am interested in recruiting *participants*. Unfortunately, the number
>of users far exceeds the number of participants.

That's human nature, Gary, and you will never change it, no matter how
you struggle. Better you should adapt to the facts of life, and learn
to exploit them to your advantage than to continue to rail against the
80% who will NEVER know or understand what you're doing. At least a
few of those "undesirables" may just see the light if they get the
chance. You can't filter them out beforehand with elitist rules and
attitudes, any more than CW testing can filter out lids.

3911. MFJ1270 And Yaesu 2m/70cm Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-04 00:00:00 UTC
From: niel brieger <nbrieger@ix.netcom.com>
Message-ID: <33BDBF83.4D8@ix.netcom.com>
Source record: 28725

I'm wondering if anyone has successfully gotten the MFJ1270 TNC and the Yaesu 8100R(or the 8000) working together. I connect the two up, try to do the calibration, and the MFJ says it's hitting PTT, yet the Yaesu makes no indication of this. The owners manual of the Yaesu leaves a lot to be desired.

From what I can tell, the MFJ needs Mic Audio, Ground, PTT, and Receive Audio. No problem. The problem is the Yaesu....they have their wires labeled PKD, GND, PKS, RX9600, RX1200, and SQL. After visiting the TAPR home page, it appears since I'm using the 1270C, I don't need to connect RX9600, or the SQL. From what I can tell, I need to connect GND to Ground, PKD to the TNC's Mic Audio, PKS to the TNC's PTT, and RX1200 to the TNC's Receive Audio. The doc is horribly confusing. Has anyone attempted this and had success?

Thanks for any help or replies you can give me!

Sincerely,
Niel Brieger, KC5ZJR

Delta Airlines found that out.

Unix isn't just for the backroom, though it is dominant there. It also has a significant share of the desktop market as well. Every Sun workstation runs it, as do HP machines, Silicon Graphics machines, and those of other workstation makers. Plus millions of Linux CDs have shipped. And since those aren't restricted by license to being installed on single machines, lots more Intel boxes (and more than a few Alphas too) than the shipped CD numbers indicate are sporting Linux. There's no way to know how many copies have been downloaded directly over the net, but that number isn't small either. Byte claims Linux may be running on more machines than any other flavor of unix.

Of course because Linux is essentially free, ships with complete source code, has tons of system tools included, has an enormous wealth of free applications available for it, and has a decades long refinement of its paradigm, it can offer by far the best price/performance ratio for the desktop. Shrink wrap vendors loathe it because it leaves them few niches to fill.

>> In the real world, Linux is not yet a choice. Perhaps someday when there
>> is the same level of support provided by HP, Sun, DEC, but not now.
>> We have zero (not one) requests from our customers to support Linux.
>
>I agree, the linux base is quite small. But we were talking about an
>Arcane operating system, not a version of it.

The Linux base isn't that small. Most smaller ISPs (and some of the larger ones too) are doing web service on machines running Linux, frequently mail and news too. Some Fortune 500 companies, including a major multinational oil company, and even some of the larger banks and Wall Street brokerage houses, have switched over completely to Linux on the desktop (as reported in Byte). That's because of the ease with which vertical applications can be developed and distributed in house for it. Linux isn't just for the hobbyist or for engineers whose companies won't spring for a Sun on their desktop. It has found its way into ordinary business environments too. It integrates seamlessly with the big unix iron in the corporate back room. And it already provides what Microsoft

is only promising, a way to maintain enterprise-wide consistency and maintainability among all of the enterprise's machines. MIS loves that.

Vertical market integrators particularly like it, and you'll find it in doctor's offices, auto repair shops, parts houses, drycleaners, garment manufacturing plants, grocery stores, etc. Because of the wealth of *free* tools available for it, a vertical market integrator can often produce a complete turnkey installation without ever having to produce more than some shell scripts. But he can charge the customer just as if he had to write or obtain expensive special purpose software for their application. (As far as the customer is concerned, it is just a menu driven turnkey solution to his computing needs. He never need see the OS underneath his application.)

Even PC Magazine has had to take notice of Linux as a viable OS for commercial operations. Lack of OS vendor support has turned out to be a non-issue too. Linux production releases are some of the most stable OS code available. And the large developer community for Linux has found that their best source of support is right on the net, from the folks who actually wrote the code. And for those intimidated by that level of support, there are a number of consultants who can supply third party support at the hand holding level.

Meanwhile, Microsoft will give you a detailed and technically correct answer to any question you put to their support staff, if you pay for support, but the answer will be completely useless to you. (Their support basically boils down to the user asks "I did this and it did that, what should I do?" and the reply is "We know about that problem. We might fix it some day (you can't because we won't release source, nyah, nyah). Meanwhile, don't do that." Ugh. The stock answer to Microsoft OS problems often boils down to the three Rs, reboot, reformat, and reload.

>Your assertion that "NT is running a LOT of ... applications" doesn't
>really tell us why Unix is arcane though. It just argues that NT is not arcane,
>and Unix is, I guess??
>
>Hmm, oh well...

Indeed. I know which way I lean, and it isn't toward Nice Try. (Though it is a nice try, compared to Win95 or Win3.1.) Unix has the reputation of being arcane, but the reality is that for system administration DOS, Windows, and NT are generally worse. Under Windows, package installs require typing "setup" while under unix you type "make install". Red Hat's RPM system makes it easier to install, upgrade, manage, or remove packages than it is to deal with Win95 or NT's registry and countless DLLs. Unless a shrink wrap application comes with a competent uninstall program (and few do), cleaning up after it can be an exercise in frustration. In can be extremely frustrating to install, upgrade, or remove packages under Windows or NT, and to insure that a given mix of packages will be compatible with each other, but it is generally simple to do so under unix. Configuration requires editing plain text files under unix, but often requires obscure and seriously arcane binary configuration under the Microsoft OS's. If configuration becomes corrupt under a Microsoft OS,

the most expedient solution is often to reboot, reformat, and reload rather than trying to chase down and repair the configuration data and orphan DLLs.

And for the user, given the graphical shells now offered by unix, routine operation is little different from the other point and click OS's, except there is generally less need to reboot between applications. I have to keep several configurations on the Microsoft OS machines, which require a reboot to activate, in order to run different applications. I don't need to do that with unix. As Microsoft has moved toward delivering a real OS instead of a program loader, the degree of system knowledge required of the user has increased to the point where it now surpasses that required of the unix user. And in the increasingly networked desktop world, the Microsoft OS's can be a royal pain while unix is essentially network transparent.

The main reason that unix systems have been considered arcane in the past is that they ship as a Swiss Army knife while the Microsoft OS's ship as a plain sodbuster. The number of tools available to the user under unix can be intimidating at first, but for the Microsoft user those tools often aren't even available, or are expensive shrink wrap additions which often aren't compatible with each other. When you compare a Windows or NT machine loaded with the third party shrink wrap needed to duplicate the functionality of stock unix, it is the Win/NT system which is truly arcane.

This wealth of system tools has also led to the idea that unix is a huge OS, but that isn't true. The core functionality of Linux can fit on 2 diskettes, and can run well on what is today considered a very minimal set of hardware. Even DOS won't fit on less than 2 diskettes today, but it offers much less functionality. Win95 and NT generally must ship on CDROM, but they still don't offer the functionality of unix without the addition of a number of expensive shrink wrap tools. And I'm constantly amazed at the amount of system resources needed for Win95 and NT in order to run well. And they still often crash under demands which would hardly have unix raising a sweat.

DOS and Windows may still claim the lion's share of the desktop market, but when you contemplate moving to NT, Linux begins to look like a very attractive alternative. It offers more power and functionality while costing much less. It is easier to administer competently, and it requires no more knowledge from the user than operating under NT (actually less in many cases). For the software developer, it is a two edged sword. On the one hand, it is the nearly ideal development environment. On the other hand, it doesn't leave a lot of need for mundanc shrink wrap tools, so the developer is challenged to come up with novel programs to serve functions which aren't already available as part of the native system.

Not only that, but did anybody notice what they were using to view the pictures on their workstation. It certainly didn't look remotely like a Bill Gates product but had more than a passing resemblence to Xview.

(For those who are not "in the know", Xview is a UNIX application, running under Linux and no doubt BSD, Solaris and other flavours of UNIX).

: > reliably as a Novell or UNIX server. Its just not gonna happen any time
: > soon ...

: You need to get over to that library and read the trade journals.
: A lot has happened in the "real world" over the past year or two.
: NT is running a LOT of mission-critical applications in a LOT of
: companies now.

Please provide a list of corporations using Windows NT in applications
where lives are at stake; i.e., where the Windows NT product directly
controls computers that are used to operate traffic signals, route 911
traffic in a telephone network, or to do similar functions requiring
24x7 performance without unscheduled human intervention. I'd appreciate
a list of the names, titles, and phone numbers for those that supervise
the application. You may email me privately if you choose.

[snip]

: > The trade mags may have you believe that NT/95 is the head of the pack,
: > but its really just an inside joke of theirs to promote Windows. [snip]

: So you don't beleive what is reported in the trade press?
: Ah! A religious fanatic. Never mind, ignore everything I wrote.

Critical thought is usually a cure for fanaticism of any type (including
that which denigrates different views): it's a good idea to examine the
claims made in the "trade", or any other, press. I don't accept what is
written in the trade press without question: because I know that their
"trade" is selling advertising to corporate sponsors, I think of "trade"
magazines as well prepared advertising brochures. The Golden Rule
applies.

That doesn't mean that what the "trade" press says isn't true. It just
means that it might not be the whole story.

: And how does NT compare against Unix market share?
: You will be surprised ...

That depends on the market. I'm not aware of a single supplier in my
industry using a Microsoft product for any application that has
"trusted" access to real time event control capability.

Don't infer that I hate or love Microsoft. NT is a tool, with a place
on my shelf right beside DOS, Linux, AIX or MVS: each has strengths and

weeknesses. Just remember that no *single* one of them is suited for all occasions: getting off a bandwagon can be awkward when the music stops.

SS> help that you could give would be most appreciated.

From the manual, Appendix E
-Remove IC U40 (put in a safe place in case you want to "downgrade"
again)
-jumper pins 10 and 16 (ten and sixteen) of the U40 socket
-Check that R14 and R15 are 100 ohm resistors
-remove bbRAM batery
-exchange EEPROM U23 with the "thenet" eeprom.
-set JMP15 to the correct position (1&2 for 256k, 2&3 for 512k)
-remove jmp 9
-cut trace at jmp X

(omiting all safety/dissasembly-things, in short: disconect
everything, be careful, solder nicely, careful with ICs etc.)

Hope this helps

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative >themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.
SEND TO: Photo Phoenix International

That's what I gathered from NASA's telcom webpage. It is probably right, considering the thing locked up and then spontaneously rebooted twice Saturday. That's the signature of a Microsoft OS. I am somewhat surprised, though. I would have expected an embedded realtime executive.

This is drifting even more of the topic, but I would like to add some historical perspective to the discussion. About a decade ago those people involved in serious data processing considered unixes to be full of security holes, containing lot of more or less fatal bugs and in general considered it to be a hacked together system. Unix systems were tolerated as engineering workstations, where some failures usually did not have company wide consequences.

It is interesting to note what ten years of development and high commercial pressure has done to various flavors of unix. It is interesting to see if MS products mature in the same way in the next ten years, or will all new versions contain more and more features and consequently even more and more bugs.

In general, I do not install the version x.0 of any operating system, not even VMS (which recently has been quite stable), to any critical systems unless I have to (required by some essential application software) but usually wait for x.1 or x.2 versions. Apparently MS is going to jump directly from Win NT 4.0 to 5.0, so I probably still keep some systems at NT 3.51 level :-).

I don't see how any one can take serious a jerk that posts from an x-rated site. Click on the page at the bottom of his posts and take a look. Quacksome,maybe if you were'nt tossing off all day on sexzilla.com you could learn some new op platforms. Everyone looks at sites like that but to actually post from one shows without a doubt just how flawed and screwed up your psyche really is. What a sicko! Go back to your live strip show freak!

>Just look at those incredible pictures from Mars:
>
>http://mpfwww.arc.nasa.gov/default.html
>
>If they don't kickstart interest in terrestrial packet, then nothing
>will!

Of course those pictures are coming from the lander. The robot
will be using 9600 baud GMSK to send its 1 Mb MPEG pictures
back to the lander for relay to Earth. That'll require some patience,
but of course the robot's top speed is 1 cm per minute so the
pix don't have to come back all that fast for the operators to be
able to drive it. And there won't be any contention on the channel
up there.

They're operating ordinary half-duplex packet using TCP/IP
protocols. The antennas are from the Smily antenna company
and the radios are Motorola UHF units, 100 mW power, and
no TCXO. They have to use electric heaters to keep the radios
warm enough to stay on frequency. This sounds remarkably
like something hams would throw together.

Their link budget calculation shows the range of the system is only
10.2 meters. That sounds awfully short, but they want a 1E-7 BER
in the multipath provided by ground clutter. The antenna on the robot
is only 83 cm above ground and the one on the lander is only 80 cm
above ground. In the extended mission, they plan to drive out further
while tolerating some resends.

The alarming thing is that the robot's computer is running a Microsoft
OS. That's just great, they'll get a General Protection Fault just when
they need to turn it to avoid running into a boulder or over a cliff. :-(

I would have expected that they'd use a realtime multitasking
executive for the robot's OS. Obviously they're doing this on
the cheap, but at least they could have run Linux. :-)

Hello,
I want to run TCP/IP packetradio under DOS.
I use aPentium PC with W95, 9600Bd TNC (DJ9), Kentwood TM-V7.
Now I use GP as the terminal application.
But I like to run NOS, JNOS or what ever it is called under DOS.
I have an IP address.
Who can tell me where to find a self installing and configuring
DOS-NOS program with doc/help files ?
I'd really appriciate.
TNX in regards Chris PA3GML

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.
SEND TO: Photo Phoenix International

This is another interesting revelation about yourself, Glen. I remember there was a day I levied not an unkind word nor insult towards you in an effort to cooporate in the BBS forwarding system between Boise and Portland. Even though I had been warned by others about you, I still started out with the idea, everyone deserves the benefit of the doubt.

I had NO control over hilltop nodes, none were locked out, it was a totally open system at that time. Due to poor hilltop node links, you come to some silly notion that I was trying to restrict forwarding to your then AA4RE BBS system. Remember the time Glen???

You turned on me like venomous viper. You and your crew of so-called "network experts". YOU brought everything down upon yourself calling me and everyone in between every filthy name in the book.

I shouldered as much as I could, trying in vain, to explain that I had nothing to do with the poor radio paths at that time, but yet, you persisted. YOU and your "network experts" created the ground floor that destroyed any cooperative effort that may have evolved between Portland and Boise.

You don't deserve any kind consideration from ANYONE involved with packet radio networking. You are an EXTREMELY hateful person, who wishes nothing but to spew out hateful prose to anyone that will give you the saticifaction of responding to your childish foul dispostion.

YOU need to do amateur packet radio a favor. Sell your computer and take up reading the bible, for a hobby. PLEASE!!!!

As for Hank, you are his puppet to further his non-sense, yet you STILL haven't figured this out on your own. Such a pity.

Actually, one of the magazines that I get at work (EDN Product News, I believe) had some interesting details. The lander was supposed to contain an IBM RAD-6000 processor (PowerPC), while the rover contained an 80C85 uP running VxWorks from Wind River Systems. This is definitely *not* a Microsoft product and does have tcp/ip support built-in. I know from when we purchased VxWorks licenses for SPARC processors in the past, they weren't cheap!

Low power consumption? TCXOs may not survive bouncing about very well.
They need the heaters anyway at -60C, otherwise the batteries would
not work.

DOS is very stable. I doubt they need a WIMP front end or multitasking.
Unix would be very inappropriate.

According to Electronics Weekly 25th June, they are using Wind River's
VxWorks RTOS.

Years ago, when I was looking for a source of EMI, I would take an IF
can and connect one of the coils to a VTVM and find the leaky spots that
way.

I guess some one could do the same with an RF Coil in a small metal
juice can across the Source Gate of an FET Amp or between the inputs on
a high bandwith low current Op Amp (with an appropriate feedback
resistor.. Then you could hook headsets and a meter to the output and
find the leak.

Good luck
Ralph

What else are they going to use?? They don't have a choice.
Those in the real world do. Show me the evaluated statistics
of theirs over the others, in the same application. Can't do it;
they never evaluated others product. How could they.

They are probably doing what everyone else is, migrating from Unix
Workstations, to Windows workstations. NT is the Windows workstation
of current favor. The reason is, that you can compile and run Unix
applications on it, and Windows applications. More bang for the buck.

But if you look at HP Unix boxes in development, they are much more
powerful
in multi-cpu architecture.

Oh ... it's clear now ... to meet Hank's religious tests, one must use
his
dumb-terminal-login/BBS paradigm and participate in its rituals (like a
"WP" entry ...) or one "doesn't exist" ... how amusing ...

That's what a lot of this is about ... Hank railing against those who want
to
and/or are moving on to better paradigms that obsolete his antiquated
methods
and the religious beliefs founded on the basis of his ego-centric view of
how
packet radio should be (based on the paradigms that he in some part
originated,
that is ...)

That Hank hasn't a clue as to my packet capabilities is actually quite
funny ...
he believes himself to be so all-knowing, but that's laughably far from the
truth.

So, we can actually make use of a terabyte of data over even a 4 pentium x 4 x 100Mbps ethernet system and connection? It can only be stored on one MS machine to my knowledge. Unix allows a distributed paradigm much more easily which allows network switches and multiple servers to distribute load evenly.

Plus, so what? Novell 4.11 supports up to 32 terabytes of storage . . . and there is plenty of software that could make use of it should the need arise (but right now, I couldn't dream of any application where one would need that much storage, at least that much storage with the limitation of even a 45Mbps direct/switched connection). There currently isn't readily available processor power or network bandwidth to support such monsters.

How in the world does the fact that HP is going to support NT support your conclusion that Gary's illusion that NT doesn't ship on HP workstations but Unix does is shattered? But, alas, NT has not been released for PA-Risc as of yet. May I remind you that NT graphics drivers are rung 0, a technical mistake that makes NT very undependable for a large number of hard core graphics based applications that UNIX has reliably supported for years. So, HP may have signed on to support NT but in reality they will still be selling mainly Unix machines. If HP was to ever drop Unix, I can guarantee that their workstation business would flop immediately.

I talked with a Novell/Microsoft solutions provider today. He makes good income off of both systems, but his opinion is that SQL and similar packages are about the only applications well suited or even running reliably on NT for the long haul. He said when a corporation needs high performance file servers, Novell still outperforms NT in raw speed, easiness of administration, and reliability.

And if you would like to backup and place your bets on 5.0, it can only be worse, as to promote NT as a fit-all-PC type of OS like 95, NT 5.0 and 97 will be using the new crossplatform device driver standard, meaning any crap for 97 will work under NT, making NT's foundations even shakier . .. wow, MSWNT looks real impressive . . .

BTW, on MS-NBC's coverage of the Mars survey this weekend, they were running a SG workstation, running the SG Unix flavor and X Windows, not NT. I just could hear Bill Gates, jumping up and down, screaming about it. I did notice that the graphics people had trimmed off the X interface windows edges after the first hour or so, though the real facts about the OS were eventually leaked by a NASA engineer. I could even make out the jpeg decoding being done by XV, a free image software package that comes with Linux (well it may actually not be free, but it comes with the RedHat install, that costs about $50 bucks).

So, thanks, I'll take my arcane OS . . .

Later,

David L Pearce
dlpearce@eos.ncsu.edu

PS: I am running 95 tonight, much to my chagrin, because someone wants to buy this machine, and they will only take 95. That meant I had to remove all those configuration files and newly compiled Linux kernel, and plug and play setups, that I had worked on so diligently on. But rest assured Linux will be the system of my next one . . . Goodnight

all!

Well, yes I could. Linux is not mysterious or understood by few. Anybody
who has worked Unix can work Linux, and there are quite a few people
like that around. On top of that, going against your appliance paradigm,
there is loads of instructions and documentations that greatly simplify
Linux on the internet, if you'd only try a net search or:

http://sunsite.unc.edu/LDP

I hope this clears some of the connotations to the dictionary
definitions of the word arcane that Linux conjures up for you.

Actually it says they used those in testing the radio modems themselves. Nowhere else is Microsoft mentioned. Maybe testing is about all they were used for. I would be hard pressed to believe they could get all the needed MS components for a solid system onto one ROM that could be called space-worthy.

Hello everybody,

This is my first posting to this newsgroup. Since most of my leisure time goes into hamming(I do not have plenty of them however) I want to keep myself abreast of the happening in these newsgroups and also in related places. I would humbly request to please let me know what other newsgroup are there for ham realted topics.

I have a question, I do not know whether it is relevent to talk about it or not. But still let me go ahead.

My Icom IC706's serial number is 009793. I read somewhere that some of the early models of this rig had a incorrect wiring of the front end bandpass filter because of which the radio exhibits irregular sensitivity on the lo and hi VHF bands. I could not find anyone from Icomamerica over phone or e-mail to answer to my question and hence I decided to post about this issue. Can some one help me on this count please. Thanks a ton in anticipation.

Bye for now and see you soon.

Sid, vu2sid
(Siddhartha Bhattacharjee)

NB: The opinion expressed here are mine and not that of my employer.

Is there a USART that's pin-compatible with the 8250 so that I could plug it in to the empty COM2 socket on a serial board and go from there?

>started out with the idea, everyone deserves the benefit of the doubt.

Bwahahaha! The fact that the Lockout Lids felt they had to "warn" you
about me shows just how effective we were in exposing and routing
around their silliness. Instead of getting into the spirit of Ham
Radio, they went on a campaign of character assassination. They're
all gone from local and regional packet now, Mikey, even you.

>I had NO control over hilltop nodes, none were locked out, it was a
>totally open system at that time. Due to poor hilltop node links, you
>come to some silly notion that I was trying to restrict forwarding to
>your then AA4RE BBS system. Remember the time Glen???

Unlike you, I've put most of that crap out of my mind. I still have
much of the traffic archived, however. I'd go dig it out to prove
just how wrong you are about all this, but I don't care to waste my
time, and more importantly, I don't care to waste the time of the
readers on what's basically a local matter.

The fact is that YOU did any locking out that was done, not me.

>You turned on me like venomous viper. You and your crew of so-called
>"network experts". YOU brought everything down upon yourself calling
>me and everyone in between every filthy name in the book.

Well, of course. It's all my fault. You are just the innocent
victim here. You must be one of those nasty "liberals" I keep
hearing so much about on Rush's program.

>I shouldered as much as I could, trying in vain, to explain that I
>had nothing to do with the poor radio paths at that time, but yet,

The radio paths were, in fact, quite good, and useable by any competent packeteer.

>you persisted. YOU and your "network experts" created the ground
>floor that destroyed any cooperative effort that may have evolved
>between Portland and Boise.

Snicker. Nice attempt at revisionism, Mikey, but no objective observer who was around at the time is going to buy any of it. The fact of the matter is that I and my "network experts" may yet get a system working between here and Portland. All that's needed is to develop one site. Of course, you neglected to mention that the only thing that's preventing seamless forwarding NOW on that route is the Lockout Lid tactics of YOUR buddy, Earl Medeiros, WB7RES.

>You don't deserve any kind consideration from ANYONE involved with
>packet radio networking. You are an EXTREMELY hateful person, who
>wishes nothing but to spew out hateful prose to anyone that will
>give you the saticifaction of responding to your childish foul
>dispostion.

Heh. No comment.

>YOU need to do amateur packet radio a favor. Sell your computer
>and take up reading the bible, for a hobby. PLEASE!!!!

You don't want folks around who remember what actually happened, eh? I don't blame you for being nervous.

>As for Hank, you are his puppet to further his non-sense, yet
>you STILL haven't figured this out on your own. Such a pity.

Snicker.

>N7KMJ

OK, Mikey, enough with the trolling. Let's get back to the purpose of this newsgroup. I'm really not interested in cranking up some old feud. As far as I can tell, you're not a factor in packet radio in the PNW any more, and that's a Good Thing, no matter how you look at it.

No, it's almost exactly opposite to the way you use it. In the
Mars/JPL scenario, the radio link is the WAN, and the terrestrial
wirelines are the LAN/MAN links.

> IE radio links where they work best and wireline
>links where they work best.

In fact, wireline links work "best" for almost everything you're
doing, I'd venture.

> The right tool for the job. That's something a
>BBS Lid like you can't understand.

This is Ham _radio_. We use radio because that's what our
hobby/service is all about, not because it's the "best" tool for every
job.

a
> BBS Lid like you can't understand.

Radio is the "right tool for the job" if your "job" is amateur radio. I
wouldn't expect you to understand, but lots of the folks reading this will
instantly know what I mean.

Got your terminology wrong there, Gary.. I'm no kind of LID at all.

LandLine Lids get their name from their operating procedures.. The way they
lessen the enjoyment of thousands of hams worldwide by working to destroy
the amateur packet radio network.

BBS SYSOPs are largely responsible for packet radio's growth.. Instead of
tearing things down like LandLine Lids, we build things instead.

Get your story straight, next time.

And if the frequency of Error 404 and Server Unreachable on their website
is any indication, the thing must crash several times a day. Delta Airlines
tried to switch from a unix based server to a NT based server for their
reservations system. They couldn't keep it running long enough to deal
with reservations for one day's departures.

Yep, they did, but you don't see any of their workstations shipping with it do you?
HP has signed on to a lot of things, deals with IBM, deals with Apple, deals with
Microsoft, deals with Sun, deals with Digital, etc, but they haven't followed up on
a lot of them. In many cases, signing was just a temporary political alliance intended
to forward other objectives.

I'm not surprised. It is ideally suited to serve as an internet server. And it is
free, always a plus in any business situation.

>
>Evidently some people don't understand the meaning of "arcane" or are
>using it in different contexts.

My dictionary offers, arcane "understood by only a few: secret: mysterious:
esoteric". With several million copies of Linux in use, and millions of copies
of other flavors of unix in use (often by many more than one user thanks to
the multiuser nature of unix), for over 20 years now, I'd hardly consider
unix as being understood by only a few. And with the large included documentation
base (man pages), and the wide use of unix in university courses teaching OS
internals, I'd hardly call it secret either. To those who haven't used it, however,
it may seem mysterious and esoteric. It isn't really. If you know DOS, you already
know many unix commands (because DOS copied them), and have a working
understanding of the hierarchical file structure which DOS borrowed from unix.
DOS didn't go far enough, however, since it doesn't treat everything as a file,
and it doesn't preemtively multitask or support multiple users. It can't, its "kernel"
code isn't reentrant.

And indeed, that's what they're using. My earlier information was in error.
The robot is running a multitasking embedded executive called VX on
an 80C85 processor. The reference to Windows must have been talking
about the platform used to develop the code rather than the platform and
OS used to execute the code.

Make MONEY...
The fact that so many people have taken the time to post to 250 newsgroups
or more should convince you that this one REALLY works!!!!! Look at this
man's story, then the rest of the original:

I thought, what the heck, I'll try it. It's only six dollars. I didn't do
it right at first, I only sent out to about 30 newsgroups. But, I got back
my six dollars and actually made $159.37 in a week (someone put
some change in the envelope). Anyway, now I'm going to do this the
right way; send out to 250 newsgroups! The rest of this letter is just a
cut and paste from the original. All I can say is that it works. I
would never have believed it if it didn't happen to me. Just remember, we
must all follow the rules. Be HONEST and FAIR and you will make money!
Sure is a lot of mail though!

Thanks for reading!
C.L.
^^
MAKE A FORTUNE - AND THIS IS THE ABSOLUTE TRUTH!

IF YOU HAVE READ THIS FAR YOU HAVE ALREADY PROVED IT WORKS!!

Take just 5 minutes to read this and see.

This is the newest updated version.

As I was surfing the net, I read all these postings on how you can make
over $50,000, even $800,000.
Well I believe that if all goes well, and you follow the rules EXACTLY,
it
will work. Just follow the
instructions given in this letter, and you to can make over $800,000,
perfectly legally according to USA
Post Office Laws (read on for specifics). Don't look at this as a
money-making scam, but rather a true-to-
life example to test the above statement. It will only cost you $6
dollars
plus 6 stamps, and a few hours of
your time. Thus, there is some effort involved, because nothing in life
is
absolutely free. Are you ready

and willing to accept that you deserve to receive a fair amount of money?
If so, please continue reading.
But if you think this is just another scam, I suggest that you don't try it.

PLEASE NOTE: THIS IS A 6-PERSON LIST, NOT THE USUAL 5. PLEASE DO NOT TRY
TO CHEAT THIS PROGRAM. JUST ADD ONE NAME AND REPOST THE ARTICLE. IF YOU DO
NOT IT WILL NOT WORK, AND YOU WILL BE REMOVED. FROM THE LIST! FOLLOW THESE
DIRECTIONS AND JOIN US IN A GREAT OPPORTUNITY!

The program has been revised and you will notice six names instead of five.
The reason for this is the
flood of five name programs and the sixth name will add $50000 to $100000.
This is proven mathematically and in my bank account. I never really thought that this program would work, but IT DOES and it will for you too.
Just be patient and follow the directions exactly. Print this article now,
so you have all the information for your version. Remember to keep the names right. Let's go!

STEP 1

Invest your $6 by writing your name and address on six separate pieces of
paper along with the words:
"PLEASE ADD ME TO YOUR MAILING LIST".
(In this way, you are not just sending a dollar to someone; you are paying
for a legitimate service.)

People have asked me if this is really legal. It is! You are using the Internet to advertise your business. What is that business? You are assembling a mailing list of people who are interested in home based computer and on-line businesses and methods of generating income at home.
Remember - people send you a small fee to be added to your list. It is legal. What will you do with your list of thousands of names? That's up to
you, but this is how it becomes legal. To be legal you must actually sell a
product or service if you expect to receive a dollar. Anyone sending a dollar back to you must receive something in return. You have already received this letter due to the participation of each of the 6 persons listed below. This letter and the plan given within this letter are a "product" that you have received. Thus, you will be sending $1.00 to

each
of the 6 persons given below in exchange for receiving this letter and
for
asking them to provide the "service" of adding you to their mailing
list.

THIS IS A SERVICE AND IS A 100% LEGAL BUSINESS OPPORTUNITY WHICH I
COVERED
IN TITLE 18, SECTION 1302 AND 1342 OF THE POSTAL AND LOTTERY LAWS.

Now, please follow the given steps exactly to receive your desired
amount
of money:
Immediately send $1 US cash (a one dollar bill, no checks, no money
orders)
to each of the 6 people on the list below. Wrap this dollar in a note
with
the words: "Please add me to your mailing list." (In this way, you're
not
just sending a dollar to someone, you're paying for a legitimate
service.)
Also, to discourage those who prey on cash in the mail, be sure the bill
is
completely hidden by the note. A woven envelope is recommended. Include
your address. You do not need to include your name. This is the key to
the
program! Also, let each person know what number they are in your letter
so
he/she knows which cycle he is receiving the $1.00 from. Make sure that
you
retain EVERY name and address sent to you, either on computer or hard
copy,
but do not discard the names and notes that people send to you. This is
PROOF that you are truly providing a service, and should the IRS or some
other government agency question you, you can provide them with this
proof.
Therefore, you will start a list of all the people who send you a
dollar
requesting to be added to a mailing list. Actually, you will want to
safeguard this list because it can generate even better responses and
much
more money later! Fold a $1 bill inside each paper, and mail them by
standard mail to the following six addresses:

1) Rudolfs Osins
Aspazijas 37-4
Jelgava, LV 3001
Latvia
2) J. DiMauro
89 East Squire Dr. Apt. 1
Rochester, NY 14623

USA
3) D. Fenter
24 Hornsilver Place
The Woodlands, TX 77381
USA
4) R. LAWSON
P.O. BOX 842
BRISTOL,VA.
24203-0842
USA
5) B. Cody
1156 Auraria Rd.
Dawsonville , GA
30534
U.S.A.
6) C.L.W.
3015 So. Coker St.
Greenwood, AR.
72936
USA

STEP 2

Now remove the top name from the list, and move the other names up. This
way #6 becomes #5 and so on. Put your name in as the #6 on the list
(Remember to take #1 off and change the numbers so #2 becomes #1, #3
becomes #2, #4 becomes #3, #5 becomes #4 and #6 becomes #5 and you become
#6.)

STEP 3

LET ME TELL YOU HOW MUCH MONEY YOU CAN MAKE.

How do the numbers work for potential income earnings? Assume for the sake
of example that you get a 7.5% return rate. This is very conservative; my
first attempt was about 9.5%, and my second was over 11%.
1. You send out 200 letters, and 15 people (7.5% x 200) will send you $1
each. $15.00
2. Those 15 send out 200 letters each, and 225 people send you $1 each.
$225.00
3. Those 225 send out 200 letters each, and 3,375 people send you $1
each.
$3,375.00.
4. Those 3,375 send out 200 letters each, and 50,625.00 people send you
$1
each. $50,625.00
5. Those 50,625 send out 200 letters each, and 759,375 people send you
$1

each. $759,375.00
6. Those 759,375 send out 200 letters each, and 11,390,625 people send you
$1 each. $11,390,625

TOTAL $12,204,240.00!! That's 12 million dollars. If those figures sound
incredibly high, figure
that even with half the return rate, or even a quarter, the total is still
spectacular. It works every time, but how well will depend on how many
letters you send. In the above example you mailed out 200 letters. This
sounds like "pie in the sky," but the numbers add up, and with over 40
million people on the NET, it works! TIP: For an even greater return,
post to MORE than 250 newsgroups initially; try for 300-350. When your
name drops off a list, simply access another message from a newsgroup and
start the process over again. Post the new article to at least 250
newsgroups. remember, the more you post, the more people see, and the more
you get. There are at least 25,000 newsgroups at any one time. This is a
$7.92 investment. It takes about a week or so to start seeing a return-so
be patient. The money should flow for about 3 months. At that point, simply
add your name to the list and start over. I've done this three times and
now I can quit my job and start investing in real estate full time. I
assure you this can work. If you mailed out 500 letters, you could have
received even more! Check the math yourself, but I guarantee it's correct.
With this kind of return, you have got to give it a try! Try it once, and
you'll do it again. Just make sure you send a dollar to each of the
addresses on the list above with a note asking to be added to their mailing
list. Together we will all prosper and we will be able to share our wealth
with those less fortunate than ourselves.

GOOD LUCK!!

GENERAL STEPS ON AUTOMATING THE PROCESS

If you have Netscape 3.0 do EXACTLY the following:
1) Click on any newsgroup like normal, THEN click on 'TO NEWS', which is
on the far left when you're in the newsgroups page. This will bring up a
box to type a message in.

2) Leave the newsgroup box like it is, CHANGE the subject box to
something
flashy, like, "NEED
CASH $$$ READ HERE $$$ or "FAST CASH"!!!

3) Tab once and you should be ready to type. Now, retype (only once)
THIS
whole article WORD FOR WORD, except insert your name at #6, and remove
#1
off the list, plus any other small changes you think you need to make.
Keep almost all of it the SAME!

4) When you're done typing the WHOLE article, click on FILE in THIS
BOX,
RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST BOX.
Click
on SAVE AS when you're under FILE. Save your article as a text file to
your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO
THIS.
Once saved, move on to number 5 below. NOTE: If you don't want to type
in
the whole article by hand, AND you know how to use a plain text editor
(like Notepad), you can edit the file ahead of time, then attach it as
shown in step 6.

5) If you still have all of your text, send or post to this newsgroup
now
by just clicking send, which is right below FILE, and right above Cc:

6) Here's where you're going to post all 200. OK, click on any
newsgroup
then click on 'TO NEWS', again in the top left corner. Leave the
NEWSGROUPS BOX alone again, put a flashy subject title in
the SUBJECT BOX, hit TAB once you're in the body of the message. Click
on
ATTACHMENTS, which is below the SUBJECT BOX. You will get another box
to
come up. Click on ATTACH FILE, then find YOUR file that if you did this
right, you should see your file name in the attachments box, and it will
be
shaded green. NOTE: If you don't want to type in the whole article and
you know how to use a plain text editor (Notepad), you can edit the file
ahead of time, then attach it.
****
1) IF YOU USE I.E. EXPLORER IT'S JUST AS EASY...HOLDING DOWN THE LEFT
MOUSE BUTTON, highlight this article. Then press the "ctrl" key and the
"c" key at the same time to copy this article. Then print this article
for
your records, to have the names of those you will be sending $1 bills
to.

2) Go to the news groups and press "post an article". A window will
open. Type in your headline in the subject area and then click in the

large window below. Press "ctrl" and then "v" and the article will be
placed in the window. If you want to edit the article, do so and then
highlight and copy it again. Now every time you post the article in a
new
newsgroup all you have to repeat is "ctrl" and "v" and press post.

3) That's it. Each time you do this, all you have to do is type in a
different newsgroup, so that way it posts to 200 DIFFERENT newsgroups,
or
more. You see? Now you just have 249 to go!! (Don't worry, each one
takes
about 30 seconds, once you get used to it. REMEMBER 250 IS THE MINIMUM.
But the more you post the more money you will receive. AND THAT'S IT!!
THEY ARE ONLY STEPS!!!

(this is a later addition for extra ease of posting)

EXTRA TIPS:

(ONLY) IF YOU ARE CONFIDENT WITH YOUR COMPUTER YOU CAN AUTOMATE YOUR
POSTINGS (and prevent spamming) AS FOLLOWS: (THIS Replaces the previous
section only i.e. 'GENERAL STEPS ON AUTOMATING THE PROCESS') (using
Netscape):

As you are reading this message click on "file" - "save message as",
enter
a filename in the 'save as' dialog box, press "enter". Now open
"Notepad"
(usually from "start" - "programs" - "accessories") and open the message
(
"file" - "open") you just saved. (You will find it in the same folder
you
saved it and you may also find it has a '.html' file extension). Then
edit
the letter EXACTLY as you have been directed above.
Just make sure you delete the 'system-message' that appears at the top
so
that it makes sense when you read it! Click on "edit" - "select all"
(all
the text should now be highlighted) then again "edit" - "copy".
Leave Notepad alone for now and return to the Netscape News program:
Click on "options" - "show all newsgroups". Now select (subscribe to)
whichever groups you think are suitable by moving down the entire
listing
and clicking in the appropriate empty boxes. Once you have finished
click
"options" - "show subscribed newsgroups". Now simply click on the first
group you want to post to, to highlight it. Then choose the group about
10
further on and WHILE HOLDING DOWN
THE SHIFT KEY click on it. Next click on "file" - "new news message". A

message box will appear and after entering the "flashy" subject line, position the cursor in the main message area. Click on "edit" -"paste"; the message will appear.
NOW CHECK IT!!
When you are satisfied everything is correct click "send" and it will be sent to all 10 groups. Now repeat as many times as you need- very simple!
PLEASE NEVER post to many more than 10 with any one message since the resulting long lines of newsgroup listings at the top of EVERY message will
annoy many AND will vastly reduce the effectiveness of your posting.

JUST ONE OTHER THING:

Let's remember that there are many people far less fortunate than ourselves
who will never be able to afford a computer and hence will be unable to join in our enterprise. Therefore please consider donating a (significant)
portion of your earnings from the venture to charity.

NOTE -- "edit" - "copy" is exactly the same as pressing "ctrl" with "c"
"edit" - "paste" is exactly the same as pressing "ctrl" with "v"

3994. Compression Method in PKWARE?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-08 00:00:00 UTC
From: kwick@mitre.org
Message-ID: <kwick-0807970028580001@mbppp15.mitre.org>

Hello all,
I am a student at the Swiss Federal Institute of Technology. I must present Packet Radio by organising a course. I would be pleased if someone sent me any kind of interesting informations (News, WEB Sites, programs, nodes maps,...) because I am not a Packet specialist.

Thank you for your help, making our wonderful hobby beeing known in the public.

Best 73's

Yves / HB9VJV@HB9IAP.SROM.CHE.EU / yves.oesch@de.epfl.ch

PS: Send me a response direct, instead of placing it in the news, because I MUST (!) go to the Swiss Army this summer, so I won't be able to read the message!

2Moderator: Sorry if out of conference.

Hello All,

Your help is heavily requested!!!

Our company named "Multi-Communication". We were established at January 1994. Our business - trade. We have a number of branches in different countries. We employ Russian-speaking staff there. We use office alpha-numeric paging system to organise its work. We would like to buy NEC paging receivers (pagers) from you.
We would like to receive the price on NEC-21A, NEC-26B, NEC-20B and, possibly, other 2-language Cyrillic-Latin alpha-numeric pagers. Please, send us by fax delivery terms and conditions on them, too.
We consider to place an order on
1000 NEC-21A (100-200 monthly - depending on prices),
1000 NEC-20B (100-200 monthly - depending on prices),
1000 NEC-26B (100-200 monthly - depending on prices).
System:
Frequencies: 159,825+MHz and 161,950+MHz,
Rate: 1200 baud,
Format: POCSAG.
Please, call us:
007 095 921-4709,
007 095 971-5514,
007 095 971-5328.
Our fax:
007 095 921-7780.

Our email:
m-comm@dol.ru

If you have no possibility to deliver such volumes directly, please give us the list of distributors with contact numbers.

Best regards,

Dmitri Ivanov
Multi-Communication

They have a separate heater for the batteries.

Of course they don't need a GUI, but they probably do need multitasking
so that they can simultaneously control the various subsystems on the
robot. Trying to simulate multitasking in a DOS app isn't very satisfactory.
QNX would be an excellent OS for the robot, but Linux would be suitable
too. They need a pre-emptive scheduler, and both OSs have that, though
QNX's scheduler is deterministic while Linux's scheduler is not. The
cooperative scheduler of Windows leaves them very vulnerable to lockups,
such as they experienced Saturday.

Actually, the wireline portion is from JPL to the rest of the world. That's the same way we employ it, IE radio links where they work best and wireline links where they work best. The right tool for the job. That's something a BBS Lid like you can't understand.

From: tait@primeline.net
Message-ID: <5ptmghbmt1@nr1.toronto.istar.net>
Source record: 28705

I am looking for plans for a TNC-2 clone TNC, that use some of the following parts I have available:

CPUs:Z80,8088,6803 (I don't have one ,but know where there is one)

UARTs/SIOs:COM 2017,8250

PPIs:8255.

Memory:Plenty of Dram (64K,256K DIP),some Sram(2k x 4,2k x 8) ;8,16,32K Eproms.

I have an IBM XT motherboard and I/O card, I could take parts from If needed.

I have a good collection of TTL chips,and a Baycom modem I will also use.

If I must spend anything, I would like to keep it less than $50 CDN,out of my pocket,to my doorstep.

I also have an old 300 Baud modem I could use if possible.

>
>CPU:
>Z80,6803,8088

If you want to be TNC2 code compatible, you'll have to run the Z80.
If you don't need to be code compatible, any of the three will do.

>SIO:
>8250

This is a problem. You need a USART, not a UART, because packet uses
synchronous transmission. The TNC2 uses the Z80 SIO chip, other designs
use the 8530. The 8250 won't do, it's only a UART. If you don't care about
code compatibility, you can implement a software USART in the Z80. GLB
did this for their PK-1.

>Ram: 8K Sram

That's enough to run earlier versions of the TNC2 code, but you
need 16k or 32k to run later versions.

>ROM: 2764,27256

The 27256 will do.

>Modem : TCM3105

That'll work.

As noted above, if you want to be code compatible with the TNC2, you'll have to
have a Z80 SIO chip. That's a USART. The 8250 is a UART and can only handle
asynchronous data. Packet is synchronous.

The only thing I haven't seen to date is SSTV, though some folk have
used the dos version under dosemu successfully. There are PCB programs,
SPICE and others if you are a homebrew fan.

I'm interested in doing AMTOR, and I'm interested
in doing "soft error correction".

I have a Motorola EVM56002, but I haven't found
AMTOR software (I did find the RTTY.ASM, but the one I found
was recieve only and didn't do soft error correction).

What's the "hot setup" for TOR these days? I'd like
to use a DSP technique (but the DSP93 is too expensive).
Are any of the "sound card" techniques ready for prime time?
The AN93 looks good, but is an analog technique.

No, the Mars to JPL path is just a simple dedicated point to point
link. The fact that it is a *long* link doesn't make it into a WAN.
To qualify as a WAN, it has to behave as a network, IE it must be
able to support many to many switched connections. But from JPL
to the rest of the world is a network, a wide area packet switched
network that happens to be mostly wireline based.

>> IE radio links where they work best and wireline
>>links where they work best.
>
>In fact, wireline links work "best" for almost everything you're
>doing, I'd venture.

No they don't. They don't work at all in a mobile or portable
environment. And they are clumsy at best for multicast. Wireless
is better suited to those uses.

Radio is the only solution between points where there are no wires,
and it is a better solution for broadcast servers than the wirelines
because it only needs to send information once rather than repeating
it many many times to multiple stations.

>> The right tool for the job. That's something a
>>BBS Lid like you can't understand.
>
>This is Ham _radio_. We use radio because that's what our
>hobby/service is all about, not because it's the "best" tool for every
>job.

We also use wires when they are the best tool for the job. Just because we are radio amateurs does not mean that we power our equipment by broadcast power. Instead we use the wired power network or we use alternator/battery systems. And most of us don't use wireless microphones or wireless connections between our computers and our radios. Instead we use wires, because that's a more sensible solution. And our phone patches interconnect between our mobile radio systems and wireline networks. If we were fanatic about not using wires, we *could* use broadcast power, we *could* use wireless microphones and wireless data connections to our radios, but those of us who aren't religious fanatics realize that radio is the wrong tool for most of those jobs. And we *could* forego interconnecting with other communications networks, but those of us who aren't fanatic realize that interconnecting with other networks is to our benefit.

Radio is generally the wrong tool to implement a WAN, but it can be the only suitable choice for MANs and LANs which need to support mobile and portable operations, and where we may wish to distribute information via broadcast servers. Radio can also offer us local data rates which would be prohibitively expensive to provide by wirelines, IE we can implement short haul T1 over radio for a one time capital cost lower than monthly lease rates on a wired T1. But when we try to expand beyond the LAN/MAN level, radio does not satisfy our networking requirements, but the wirelines do. So, just as we use power from the wireline network of the power company, we can use the wireline data networks to augment our amateur radio systems where that makes good engineering sense.

It does not make sense to forego capabilities because the transport medium fails some religious test. We need to realize that we don't have to do *everything* via radio. We should use radio where that best meets our needs, and augment that with other transports when that better meets our needs. That's just good engineering practice, and amateurs are supposed to follow good engineering practice.

If you don't want to write code, then you *must* use the parts that the
code you'll use is written to support. If it is TAPR code you'll be using, then
you must use the USART TAPR used. You can't even substitute a better
USART, like the 8530, because it isn't code compatible at the register level
with the Z80 SIO. You can take some liberties with things which aren't
directly code driven, such as the modem chip, but those things which are
code driven must be exactly what the code expects to see. Firmware driven
systems are totally unforgiving in that respect.

As far as I know, Icom didn't make any running changes to the IC-706.
The last one made was just like the first one made as far as having an
improperly designed wideband VHF receive filter. That fault wasn't
corrected until the IC-706 Mk II.

The fix is pretty simple, however. You remove two SMD capacitors
in the wideband VHF receive filter and reinstall one of them in parallel
with one of the remaining filter capacitors. This requires a small amount
of SMD rework skill, but it gives flat response over the entire tuning range
of the radio.

The capacitors to remove are C53 and C153. Reinstall C153 in parallel
with C152 (just piggyback it on top of C152). That's it. There's a web
page which has the board layout in this area with the parts marked. The
webpage doesn't mention reinstalling C153, but you'll get a better stopband
response if you do. Since the radio uses high side injection, that'll reduce
image problems. The URL is http://www.jyu.fi/~pjka/IC-706/ic-706rx.html.

>
>What's a landline lid?? Is that one of those
>manhole covers I see in the road?

Good question. Actually, I'll be on this coming Saturday's NPR Sounds Like Science as a result of that topic. I answered correctly last month's quiz question, "Why are manhole covers round?" and got to answer questions on the air, taped for next Saturday's broadcast.

The answer I gave was NOT "because the holes are round", but I did point out that while they are round, they can also be triangular, and some such are found in Nashua, NH.

I have no idea whether Telstra, Optus, or other Aussie utilities have triangular lids, but this topic makes more sense than Brabham's spew.

Funny, we have quite a lot of HP workstations running NT here ...
Some are "servers" ... i.e. nobody every goes and sits in front of them.

Note that during the past year, there were more NT sold than Unix (all
flavors.)
Revenues from Unix sales were still approx. 5x revenues from NT sales.

Hank Oredson wrote:
>> >HP recently signed on to support NT.
>As has SGI ...

Again, who cares? SGI gives up Unix = SGI Workstation Business fails. Do you think that if NT actually came out for the Cray that Sgi is now involved with, it would be a great thing, too?

MS has never-ever written a compiler worth calling optimizing. I'd ike to see how Visual C++ would stack up against, say, gcc on the SGI. What a laugh . . . if I'm wrong about this, I'd be happy to admit it. Already the benchmarks are showing MSOffice to be faster on a 266MHz pentiumII than a DEC Alpha 500MHz. Lets be realistic here. MS has always left the optimizing to Intel, which is why MS code is always slow, as is any code generated by MS compilers, and the RISC stations will suffer in comparison on any mainstream apps as they are ported to NT.

_
>Funny, we have quite a lot of HP workstations running NT here
... _
_

>Note that during the past year, there were more NT sold than Unix (all
>flavors.)

There typically are more PCs sold than Unix Workstations . . . I never debated that point, however, whether the PC sold with NT actually became

a server or a better 95 box is a whole different statistic all together.

Perhaps you could bring some data to the discussion as I do not have this
available to me.

As to useful statistics, there were around 25% more liscenses of Novell Netware 4.x sold last year than NT server copies (and you have to remember,
some of those NT server copies ended up in a desktop machine, Novell OSs

aren't desktop OSs, I know people who run server NT at home). And there are 3 times more Novell clients being served everyday than NT clients. Not from Infoworld, but from my own experience, Unix and Novell are both

quicker at file serving under stressful loads than Windows NT, so I can see why.

Here is my analysis . . . Nt has its niche, but because it was planned as a desktop/general purpose OS, it will never enroach upon the ground in a significant enough matter to scare Novell or the Unixs because both

Novell and Unix provide speedier file serving than NT. Nt makes a great Small Area Lan (just a wee bit bigger than peer to peer, but not much), but you can forget it for massive access at this product generation and probably for several more until MS realizes that everything meant for a desktop OS is not meant for a server OS. They should do it like Novell, let a client interface to the system database and do things remotely. Leave
only the really in depth stuff like installation and system repair to the
console. Consoles don't need all those wonderful graphics nor the instability
it brings with NT. I was told by a solutions provider that their SQL server
had to have a graphics card upgrade before it could even handle the load

a particular company brought to a NT setup. On Novell or Unix, you can skimp in these areas and it won't matter . . .

Later,

Pearce - kf4mok

Oh, come on, Gary. This is an even sillier argument than mine about
the Earth-Mars link.

>It does not make sense to forego capabilities because the transport
>medium fails some religious test. We need to realize that we don't
>have to do *everything* via radio. We should use radio where that
>best meets our needs, and augment that with other transports when

>that better meets our needs. That's just good engineering practice,
>and amateurs are supposed to follow good engineering practice.

I don't deny the attractiveness or effectiveness of any of this. I do, however, see strong evidence that the move to the Internet is destroying not only the existing packet network (and yes, it IS a network) but is inhibiting the innovation and expansion of radio LANs and MANs in all but a few isolated areas. It's just TOO easy to hook up to the 'net, compared to all the hassle of coordinating, building, and supporting radio sites. Plus, there are no Lockout Lids on the Internet.

If somebody could convince me I'm wrong on this, I _might_ even get interested in convincing somebody local to hook us into the wireline net.

I resently missed the local ham radio swapmeet by 1 day! So while I was at the regular swap meet I bought a "Luxor remote controlled sat. reciever", a "Luxor remote controlled sat. actuator and lastly a "TRAKER II, satellite locator, Houston Satellite Systems, INC."{it's a digital display actuator?}
Well my question is I'm a ham who wants to know could I use the 2 actuators to control the east/west and Elevation for satellite transcieving?
Would they work with the standered TV antenna rotor?
And lastly :} the satellite reciever recieves 32 channels so does that mean C-band or KU-Band?(it has mono and (dir or mtrx) stereo. also what frequency range are they?

Thanx, Nick

Mike,

Azden is still in business as far as I know. I've seen their ads for
HT's and mobile rigs in QST and other ham magazines. Give them a call
at (516) 328-7501. I don't know whether they offer any packet
equipment. I tried their web page at http://www.azdencorp.com/ but all
that I saw listed was wireless microphone systems.

Great! When will the handheld version be available?

I'm working on a new UDP protocol, perhaps you would like to implement
it on your web site. It's called CWTP "Continuous Wave Transport
Protocol". It will allow you to send morse code over the Internet and
you can even call CQ with multicast.

Frederick Electronics?
I hope that someone may be able to help me in my quest to find information on the following Plantronics/ Frederick Electronics products.

Model 1280 RTTY modem
Model 5554 HF Exciter
Model 1202R VF telegraph receiver
Model LEM-1 duel link RTTY error monitor

Any information such as operation instructions or external connection information would be most helpful. Of course I am more than willing to pay any coping and shipping cost that you may have.

4038. CABLE TV--FREE DECODER PLANS--

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-11 00:00:00 UTC
From: Edward Witt <superted@worldnet.att.net>
Message-ID: <01bc8e48$94870f40$537074cf@default>
Source record: 28563

Now you can get new plans to build a Cable Descrambler System, US and UK plans.

This is not the origonal Radio Shack plan (now obsolete), but a choice of six new up to date plans designed to work on any cable box in any area. Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area, and you will be able to view all premium and pay per view channels.

It works on all Cable Tv Systems. The parts to make the box cost appoximately $15 (depending on the plan) and you can find them at any local electronic part supplier(US Residents will be supplied with radio shack part numbers). British Sky Cable descrablers cost approx 20 Pounds. Remember this is for educational purposes only, you still have to pay for the channels you view. I have to say that to protect myself for any liablity.

For the Plans just send $ 2 or 2 Pounds to:

Ed Hacker
409 Adams Street # 7
Hoboken, NJ 07030
USA

The reason I charge two dollars is for the stamp, envelop, and paper your plans are on. I am doing this for you not for me to make money. Lets get real you cant buy much for two bucks. I am not in this for the money but to get back at the cable companys that over charge people.

CABLE HANDBOOK (Additional $2)

Everything you ever wanted to know about cable boxes. Includes a cross reference list for upgrading your box using upgrade converts, cubes, plug-in activators and service code-generators. Also explains general cable operation, this handbook is very COMPLETE, a must have!

TURN ME ON!

Turn on all your premium channels with nothing to buy.

The Notch Filter

A notch filter allows you to selectively descramble channels. For instance, if HBO is on channel 7 and Cinemax is on channel 14 or pay-per-view is on 22, you may build a notch filter to descramble each of those channels. This method is fairly simple to build; However, it requires several more parts than the Fifteen Dollar Box. This system will work on your cable system, no matter what frequency your cable system operates on. A cable box is NOT

REQUIRED, and parts cost in the range of $25-30 depending on how many channels pay channels you wish to descramble. NOTE: I used channel 7,14 and 22 as an example. Your premium services may be on other channels and the notch filter can be built for whatever channel your premium services are on. (between the range of 2-22) Parts can be purchased from a electronics wholesaler/retailer in your phone.

The Gated Sync is the Grand Daddy of descramblers (in band and out band). It can be configured to operate on your cable systems frequency. This system is for the serious home electronics buff. It is a bit more complex to build; However, it sells for a lot of money. And, it will descramble EVERY channel.

SSAVI was created by Zenith, and used by many Zenith converters. The system is very difficult to build, but it will descramble EVERY channel, and also sells for a lot of money. Novices should not attempt to build the SSAVI system.

FREQUENTLY ASKED QUESTIONS

What is a Descrambler?

A descrambler is a device that restores the picture and sound of a scrambled channel. In most cases, ALL channels which are scrambled will be restored.

Are Descramblers legal?

YES! It is legal to build, sell, ship, use, and own a descrambler; However, when you use a descrambler, it is your responsibility to notify the cable company that you are accessing their signal.

Do I need a converter from my cable company?

In most cases NO. A cable ready VCR or TV will work.

Is it difficult to build a descrambler?

Turn me on, the Fifteen Dollar Box, the Oak converter and the Foil method are very simple methods! The instructions provide step by step instructions. No special skill or knowledge are needed. The Notch filter is still fairly simple. The Gated Sync is not for the beginner, it requires electronics knowledge.

Can I build more than one?

YES! You may build as many descramblers as you want! They are legal to sell and demand fairly high prices!

Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area
For the Plans just send $ 2 or 2 Pounds to:

Ed Hacker
409 Adams Street # 7

Hoboken, NJ 07030

I have a friend that wants to use his commodore 64 for packet. He has found an item from MFG item#1271 which makes the 64 a TNC. This item requires software called Digicom/64. It is supposedly available as freeware. I have searched for this & I am unable to find it.

Would someone please help me with this?

Also, if there are other methods to use the C64 on packet please advise.

Thanks, Jerry

Source record: 28653

Hello group,

Does anyone know of a downloadable source code (C or Pascal for 80x86) for a TNC terminal program? I have tried in vain to find one! Although there are many fine packet programs readily available, I'd like to try my hand at customizing one. Being able to review the code of an available program would give me a better understanding of how the thing should work. I haven't quite got the serial port programming down pat.

Have you considered Linux? Running a comm program (anthing using
serial ports) in a Windows 95 DOS box will give you a MAJOR
performance hit. A real operating system, such a Linux, will allow
you to use the CPU to it's fullest.

Or course, by using Linux you give up the following:
- keeping Bill Gates off welfare
- weeding through the huge mass of crappy ham software for DOS/Win
(it's all crappy, especially the TNC software)
- rebooting every time you want to change any parameters
(only one reboot after building kernel to support AX.25)
- Executing CPU consuming instructions to mix real and protected
mode applications
- blue screen errors and GPFs that can't be recovered from
- The wasteful way FAT consumes disk space (FAT32 is a little better)
- The need for a TNC, Linix supports a Sound Blaster as a TNC with
$1-5 in parts to trigger transmit. And it does 9600bps!!!
- I'm ranting, I'll stop the list now.

If you got an old 386/486 laying around, or pick one up at a swap
shop, this can be your new node. No monitor or keyboard needed beyond
initial software load. Just get a couple ethernet cards and crossover
cable or a direct serial connection if you really want to be cheap.
If you can get a 486/66 or better, you might as well go for the Sound
Blaster solution and keep your TNC for field days.

So... take that $80 or so you were going to spend on that crappy
Windows host mode software and spend it on upgrading that old
not-good-for-windows-anymore system buried in the basement (you saved
it didn't you). Now, take the money you have left over and buy you
and your XYL a nice dinner out.

You will have a full featured node. It will support AX.25, TCP/IP, NET/ROM, ROSE, BBS, GAMES, etc. AND, you can _easily_ write your own software in any language you want that can be accessed by anyone connecting to your system. AND, you get a full suite of IP software for the TCP/IP you seem interested in.

Of course, I'd be willing to use a Windows based host mode program. If I found something that was actually good. The best I found so far is KaWin, but it's not up to my standards. And let's not even discuss the state of logging/contesting software!!! Please, don't anyone bother to try to sell me on your software.

Some ideas for you:

Buy a book on ordinary serial communications. Look for one that
includes an assembly language routine for interrupt driven serial port
communications that supports 16550 FIFO. Don't worry, you only call
on the routine from your higher level language.

Contact the manufacturer of your TNC and get the documentation for
host mode interfacing. This basically encapsulates all data into
packets that your computer is responsible for decoding. This is the
magic that lets you work more than one connection at once. Or, for a
greater challenge, try KISS mode.

Use Visual C++ (or ViSLOW BASIC) and use the OCX extensions it comes
with. Or use the SDK calls for the comm driver.

Try using Linux. All you need to do is set the port speed and open a
device for input and output. Very easy. Also, check out the
extensive library of programs for Linux -- all I have seen come with
source code!!!!

4055. TNC audio ground loops

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-12 00:00:00 UTC
From: Burt Lang <burt@rocler.qc.ca>
Message-ID: <33C7CC97.6784@rocler.qc.ca>
Source record: 28570

Hi Folks.

Recently when interfacing a KPC-9612 TNC 9600 bps port to a MAXAR radio , I ran into a serious noise or "oscillation" on the RX audio line. In the end it turned out to be a ground loop caused by grounding the shielded wire from the radio discriminator at both ends. Removed ground at one end and now all is fine.

This event brought back memories of the old rule in low level audio work - namely never ground both ends of a shielded wire. But in all the reading about TNC interfacing and all my previous experience with 1200 and 4800 bps connections I have never seen any reference to ground loops or the dangers of grounding both ends of a shield wire.

Has anyone else experienced this problem with 9600 bps installations? If so, then maybe it is another fact about packet that needs to be better propagated.

I used a C-64 many moons ago with an early AEA PK-232, and thought it was
OK.. The main drawback was the 40 column screen, of course. The C-64's
serial port was only reliable for 4.8kb, if I remember correctly.

The AEA software for the C-64 was on a plug-in ROM cartridge.. The C-64
took plug-in cartridges much like the Nintendo video game machines do
today.

The new Nintendo 64, by the way, has an optional keyboard, memory upgrades,
and modem for limited Internet use. This raises the strange possibility of
(with minor modifications) using the latest video game machine to operate
packet.

Actually TCP and UDP are both protocols on top of IP, as well as ICMP, IGMP, ect.

UDP is good for low overhead packet bursts that you don't care if they get there or not. Such as non-critical telemetry data, position reports, ect. It is also a good protocol to use for paging applications.

Unfortunately NOS has limitiations to what you can do. But a Linux box or a Windows NT box running IP over an amateur wireless network can open up endless possibilities for creating amateur applications for IP.

You're probably trying to log on to a BBS right after an AOL or CIS session...you need to reset your modem to the standard 8/N/1 settings.

AOL and CIS change your modem to 7/n/1....

I've just fitted an EJ-26U CTCSS tone encoder to an Alinco DX-70. It works fine with the standard out-of-the-box voice audio deviation of 5kHz.

However, to work through the UK 6m repeaters, I've had to reduce the voice audio deviation to about 2.5kHz. Trouble is, this doesn't reduce the CTCSS tone deviation, so that now the tone is at too high a level and causes distortion of the voice audio.

There doesn't appear to be any way of adjusting the output level on the tone encoder unit. Is there any other way to do this (e.g. by twiddling a pot somewhere on the PLL board)?

IMO, video game machines should remain video games machines. I believe that the need for adding a keyboard, memory, modem, etc. to the N64 (and others) demonstrates the need to maintain the division between computer and video game platform. Sure the possibility to surf the Internet and W3 exists, however, is it worth the aggravation? The various gaming platforms were designed so that folks can play games. Now the trend is to allow various connectivity solutions with that "video game machine". We are not looking at a technological leap when a N64 is made to surf the Internet or do packet, etc. Doesn't a computer do all this only more efficiently? I say use the game platforms to play the amazing games that have been developed for them. Leave the serious applications to a machine specifically designed for "serious applications".

Pay no attention to this fool. He doesn't LIKE 1200 bd packet, and has confused his own distorted views with reality. A legend in his own mind.

The reality is that 1200 bd packet is alive and well. In fact, it makes up over 90% of all packet radio activity today. To Steve it's "dead" because it uses Radios, and is not fast enough to suit his vision of amateur packet radio as a parasite hanging off the hind parts of the Internet and other wireline nets.

Listen to HAMS, and you'll find out that 1200 bd packet is simple, inexpensive, and doesn't require constant tinkering.. It's reliable and it works well.

Later on you will most assuredly find yourself interested in faster speeds and faster computers, but in the meantime you can do quite a lot with a C-64 on packet.. To suggest that the C-64 and 1200 bd packet is "dead" to a beginner wanting to get on the air is both asinine and quite ignorant.

Good old Steve.. You can depend on him every time. A LandLine Lid in every respect.

Why did Alinco use "DIP SWITCH" selectable CTCSS tones?
It seems primative not being able to set the CTCSS tones from the
DISPLAY!

90% seems like such a "good" number. In statistics this is highly suspect.
I believe if you check your notes, you will find a mathematical error
somewhere
in your calculations. Most people have the greatest problem with addition
and subtraction. Maybe check your rounding of numbers. In many cases you
may be trying to add a very large number to a very small number, and thus
this results in floating point errors in most calculators.

Please go over your data again and report back in 90 days your corrected
calculation. This type of error is quite common among new students. Alas,
I will be forced to reduce you two letter grades for your "too quick"
answer,
and not providing the necessary raw data to substantiate your calculation.
The number is so obviously wrong, I don't think you have grasped even the
minor points of my lectures.

Professor Sampson

> and supporting radio sites. Plus, there are no Lockout Lids on the
> Internet.

It's true that amateur radio links simply cannot compete with the
effectiveness/reliability/cost of the wire network. In 10 years time
I see very little left of the existing AX.25 packet network. Locally
here a TCP/IP wormhole has just opened giving access to worldwide mail
, amateur web pages, etc over the air which is great but the cost to get
9k6 is not so appealing. It is cheaper/easier to "get connected" by wire.

I predict that AMSAT and amateur radio in space will still be very active
in the next century, some TCP/IP amateur radio Nets over the air will still
exist, most of the rest of amateur radio activities will vanish (especially
analogue modes).

Paul.

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
